(54) Title: **MYCOBACTERIAL DIAGNOSTICS**

(57) Abstract: The present invention provides nucleic acid molecules unique to *M. paratuberculosis*. The invention also provides the polypeptides encoded by the *M. paratuberculosis*- specific nucleic acid molecules of the invention, and antibodies having specific binding affinity for the polypeptides encoded by the *paratuberculosis*- specific nucleic acid molecules. The invention further provides for methods of detecting *M. paratuberculosis* in a sample using nucleic acid molecules, polypeptides, and antibodies of the invention. The invention additionally provides methods of preventing a *M. paratuberculosis* infection in an animal.

TECHNICAL FIELD

This invention relates to detection of bacteria, and more particularly to detection of *Mycobacterium avium* subsp. *paratuberculosis*.

15

BACKGROUND

The disorder known as Johne's disease was first described in 1895. Today, *Mycobacterium avium* subsp. *paratuberculosis* (*M. paratuberculosis*), the causative agent of Johne's disease, is widely distributed both nationally and internationally in domestic ruminants such as cattle, sheep, goats, as well as wildlife such as rabbits, deer, antelopes, and bison. In 1996, the National Animal Health Monitoring System conducted a survey of dairy farms using serological analysis to determine the prevalence of Johne's disease in the U.S. The results of that study showed an estimated 20-40% of surveyed herds have some level of *M. paratuberculosis*. Furthermore, it is estimated that annual losses in the U.S. from *M. paratuberculosis* in cattle herds may exceed \$220 million.

25

The pathogenesis of *M. paratuberculosis* has been recently reviewed by Harris and Barletta (2001, *Clin. Microbiol. Rev.*, 14:489-512). Cattle become infected with *M. paratuberculosis* as calves but often do not develop clinical signs until 2 to 5 years of age. The primary route of infection is through ingestion of fecal material, milk or colostrum containing *M. paratuberculosis* microorganisms. M cells likely serve as the port of entry for *M. paratuberculosis* into the lymphatic system similar to other intracellular pathogens such as salmonella. *M. paratuberculosis* survive and may even replicate within

30

macrophages in the wall of the intestine and in regional lymph nodes. After an incubation period of several years, extensive granulomatous inflammation occurs in the terminal small intestine, which leads to malabsorption and protein-losing enteropathy. Cattle shed minimal amounts of *M. paratuberculosis* in their feces during the subclinical phase of infection, and yet over time, this shedding can lead to significant contamination of the environment and an insidious spread of infection throughout the herd before the animal is diagnosed. During the clinical phase of infection, fecal shedding of the pathogen is high and can exceed 10^{10} organisms/g of feces. The terminal clinical stage of disease is characterized by chronic diarrhea, rapid weight loss, diffuse edema, decreased milk production, and infertility. Although transmission of *M. paratuberculosis* occurs primarily through the fecal-oral route, it has also been isolated from reproductive organs of infected males and females.

SUMMARY

The present invention provides nucleic acid molecules unique to *M. paratuberculosis*. The invention also provides polypeptides encoded by the *M. paratuberculosis*-specific nucleic acid molecules of the invention, and antibodies having specific binding affinity for the polypeptides encoded by the *M. paratuberculosis*-specific nucleic acid molecules. The invention further provides for methods of detecting *M. paratuberculosis* in a sample using nucleic acid molecules, polypeptides, or antibodies of the invention. The invention additionally provides for methods of preventing a *M. paratuberculosis* infection in an animal.

In one aspect, the invention provides an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 969 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:1 or to the complement of SEQ ID NO:1, wherein any such molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Homo sapiens*, *Pseudomonas aeruginosa*, *Streptomyces viridochromogenes*,

Mus musculus, *Felis catus*, and *Xanthomonas campestris* using an appropriate third nucleic acid molecule.

For example, a nucleic acid of the invention can have the sequence shown in SEQ ID NO:1. A nucleic acid of the invention can have at least 75% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:102). A nucleic acid of the invention can have at least 80% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:103). A nucleic acid of the invention can have at least 85% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:104). A nucleic acid of the invention can have at least 90% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:105). A nucleic acid of the invention can have at least 95% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:106). A nucleic acid of the invention can have at least 99% sequence identity to SEQ ID NO:1 (e.g., SEQ ID NO:107).

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 576 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:2 or to the complement of SEQ ID NO:2, wherein any such molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Thermotoga* sp., *Homo sapiens*, *Pseudomonas aeruginosa*, *Deinococcus radiodurans*, *Streptomyces coelicolor*, *Oryza sativa*, *Rhizobium leguminosarum*, *Frankia alni*, and *Mesorhizobium loti* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 522 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:3 or to the complement of SEQ ID NO:3, wherein any such molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Halobacterium* NRC-1, *Oryza sativa*, *Glycine max*,

Streptomyces coelicolor, and *Mus musculus* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 582
5 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:4 or to the complement of SEQ ID NO:4, wherein any such molecule that is 10 to 47 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms
10 selected from the group consisting of *Oryza sativa*, *Caenorhabditis elegans*, *Leishmania mexicana*, *Drosophila melanogaster*, *Homo sapiens*, *Zea mays*, *Halobacterium* sp. NRC-1, *Pseudomonas aeruginosa*, *Ralstonia solanacearum*, and *Streptomyces coelicolor* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid,
15 wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 311 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:5 or to the complement of SEQ ID NO:5, wherein any such molecule that is 10 to 36 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but
20 does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Homo sapiens*, *Streptomyces coelicolor*, *Ictalurid herpesvirus*, *Mesorhizobium loti*, and *Oryza sativa* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid,
25 wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 576 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:6 or to the complement of SEQ ID NO:6, wherein any such molecule that is 10 to 41 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but
30 does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Pseudomonas aeruginosa*, *Ralstonia solanacearum*,

Arabidopsis thaliana, *Pseudomonas fluorescens*, *Homo sapiens*, and *Mesorhizobium loti* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 474
5 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:7 or to the complement of SEQ ID NO:7, wherein any such molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms
10 selected from the group consisting of *Homo sapiens*, *Pantoea agglomerans*, *Rattus norvegicus*, *Erwinia uredovora*, *Erwinia ananas*, and *Pantoea ananatis* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 558
15 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:8 or to the complement of SEQ ID NO:8, wherein any such molecule that is 10 to 36 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms
20 selected from the group consisting of *Neisseria meningitidis*, *Homo sapiens*, *Streptomyces coelicolor*, *Arabidopsis thaliana*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Streptomyces hygroscopicus* var. *ascomyceticus*, *Ralstonia solanacearum*, *Deinococcus radiodurans*, *Rhizobium meliloti*, *Rickettsia typhi*, *Streptomyces* sp., and *Mus musculus* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 321
25 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:9 or to the complement of SEQ ID NO:9, wherein any such molecule that is 10 to 36 nucleotides in length, under standard amplification conditions, generates an amplification product from
30 *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms

selected from the group consisting of *Mycobacterium tuberculosis*, *Homo sapiens*, *Streptomyces coelicolor*, *Drosophila melanogaster*, *Ralstonia solanacearum*, *Mesorhizobium loti*, and *Pseudomonas cruciviae* using an appropriate third nucleic acid molecule.

5 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 2508 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:10 or to the complement of SEQ ID NO:10, wherein any such molecule that is 10 to 44 nucleotides in length, under standard amplification conditions, generates an amplification
10 product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Sinorhizobium meliloti*, *Xanthomonas albilineans*, *Halobacterium* sp. NRC-1, *Ralstonia solanacearum*, *Deinococcus radiodurans*, *Halobacterium salinarium*, *Micromonospora griseorubida*, *Pseudomonas paucimobilis*, and *Streptomyces lividans* using an appropriate third nucleic acid molecule.
15

 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 264 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:11 or to the complement of SEQ ID NO:11, wherein any such molecule that is 10 to 36
20 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Caulobacter crescentus*, *Brucella melitensis*, *Pyrobaculum aerophilum*, *Mycobacterium tuberculosis*, *Sinorhizobium meliloti*, and *Mycobacterium leprae* using an appropriate third nucleic acid molecule.
25

 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 1110 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:12 or to the complement of SEQ ID NO:12, wherein any such molecule that is 10 to 39
30 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid

molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Mesorhizobium loti*, *Bacillus halodurans*, *Ralstonia solanacearum*, *Homo sapiens*, *Drosophila melanogaster*, and *Rhizobium meliloti* using an appropriate third nucleic acid molecule.

5 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 672 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:13 or to the complement of SEQ ID NO:13, wherein any such molecule that is 10 to 30 nucleotides in length, under standard amplification conditions, generates an amplification
10 product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of *M. avium* subsp. *avium* using an appropriate third nucleic acid molecule.

 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 372
15 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:14 or to the complement of SEQ ID NO:14, wherein any such molecule that is 10 to 30 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the
20 organisms selected from the group consisting of *Brucella melitensis*, *Streptomyces coelicolor*, *Drosophila melanogaster*, *Mycobacterium tuberculosis*, *Trypanosoma rangeli*, *Trypanosoma minasense*, *Trypanosoma leeuwenhoekii*, and *Brassica napus* using an appropriate third nucleic acid molecule.

 In another aspect of the invention, there is provided an isolated nucleic acid,
25 wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 600 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:15 or to the complement of SEQ ID NO:15, wherein any such molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid
30 molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Ralstonia solanacearum*, *Sinorhizobium*

meliloti, *Homo sapiens*, *Mesorhizobium loti*, *Oryza sativa*, *Drosophila melanogaster*, *Rhizobium leguminosarum*, *Xylella fastidiosa*, *Deinococcus radiodurans*, *Achromobacter cycloclastes*, and *Candida cylindracea* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid,
5 wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 540 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:16 or to the complement of SEQ ID NO:16, wherein any such molecule that is 10 to 45 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid
10 molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Streptomyces lavendulae*, *Xylella fastidiosa*, *Streptococcus pneumoniae*, *Mycobacterium tuberculosis*, *Pseudomonas aeruginosa*, *Ralstonia solanacearum*, *Sinorhizobium meliloti*, *Sus scrofa*, *Mycobacterium leprae*, and *Streptomyces coelicolor* using an appropriate third nucleic acid molecule.

15 In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 291 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:17 or to the complement of SEQ ID NO:17, wherein any such molecule that is 10 to 37 nucleotides in length, under standard amplification conditions, generates an amplification
20 product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Pseudomonas sp.*, *Homo sapiens*, *Pseudomonas aeruginosa*, *Thauera aromatica*, *Oryza sativa*, *Ralstonia solanacearum*, *Rhizobium leguminosarum*, *Streptomyces coelicolor*, *Brucella melitensis*, *Drosophila*
25 *melanogaster*, *Deinococcus radiodurans*, *Streptomyces noursei*, *Rhizobium meliloti*, *Synechococcus elongates*, *Sinorhizobium meliloti*, and *Mesorhizobium loti* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 225
30 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:18 or to the complement of SEQ ID NO:18, wherein any such molecule that is 10 to 37

nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Rhodobacter capsulatus*, *Agrobacterium tumefaciens*, *Mycobacterium smegmatis*, *Pseudomonas aeruginosa*, *Ralstonia solanacearum*, and *Drosophila virilis* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 441 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:19 or to the complement of SEQ ID NO:19, wherein any such molecule that is 10 to 30 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Homo sapiens*, *Mus musculus*, *Leishmania major*, *Pseudomonas aeruginosa*, and *Botrytis cinerea* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 726 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:20 or to the complement of SEQ ID NO:20, wherein any such molecule that is 10 to 41 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Oryza sativa*, *Caulobacter crescentus*, *Rhodobacter sphaeroides*, *Streptomyces coelicolor*, *Spermatozopsis similis*, *Homo sapiens*, *Sus scrofa*, and *Giardia intestinalis* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 426 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:21 or to the complement of SEQ ID NO:21, wherein any such molecule that is 10 to 44

nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Streptomyces coelicolor*, *Homo sapiens*,
5 *Triticum aestivum*, *Oryza sativa*, *Brucella melitensis*, *Caulobacter crescentus*,
Pseudomonas aeruginosa, *Ralstonia solanacearum*, *Bovine herpesvirus*, and
Mesorhizobium loti using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 279
10 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:22 or to the complement of SEQ ID NO:22, wherein any such molecule that is 10 to 45 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the
15 organisms selected from the group consisting of *Pseudomonas aeruginosa*, *Oryza sativa*,
Streptomyces sp., *Streptomyces peucetius*, *Rhizobium sp.*, *Mycobacterium tuberculosis*,
Caulobacter crescentus, *Ralstonia solanacearum*, *Haloferax volcanii*, *Mycobacterium leprae*, and *Streptomyces coelicolor* using an appropriate third nucleic acid molecule.

In another aspect of the invention, there is provided an isolated nucleic acid,
20 wherein the nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 4415 nucleotides, the molecule having at least 75% sequence identity to SEQ ID NO:23 or to the complement of SEQ ID NO:23, wherein any such molecule that is 10 to 50 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid
25 molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Ralstonia solanacearum*, *Sinorhizobium meliloti*, *Homo sapiens*, *Mesorhizobium loti*, *Oryza sativa*, *Drosophila melanogaster*,
Rhizobium leguminosarum, *Xylella fastidiosa*, *Deinococcus radiodurans*, *Achromobacter cycloclastes*, *Candida cylindracea*, *Streptomyces lavendulae*, *Streptococcus pneumoniae*,
30 *Mycobacterium tuberculosis*, *Pseudomonas aeruginosa*, *Sus scrofa*, *Mycobacterium leprae*, *Streptomyces coelicolor*, *Pseudomonas sp.*, *Thauera aromatica*, *Brucella*

melitensis, *Streptomyces noursei*, *Rhizobium meliloti*, *Synechococcus elongates*,
Rhodobacter capsulatus, *Agrobacterium tumefaciens*, *Mycobacterium smegmatis*,
Drosophila virilis, *Mus musculus*, *Leishmania major*, *Botrytis cinerea*, *Caulobacter*
crescentus, *Rhodobacter sphaeroides*, *Spermatozopsis similes*, *Giardia intestinalis*,
5 *Triticum aestivum*, *Bovine herpesvirus*, *Streptomyces sp.*, *Streptomyces peucetius*,
Rhizobium sp., and *Haloferax volcanii* using an appropriate third nucleic acid molecule.

Generally, the invention provides an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule of at least 10 nucleotides, the molecule having at least 75% sequence identity to a sequence selected from the group consisting of SEQ ID
10 NOs:1-23 or to the complement of a sequence selected from the group consisting of SEQ ID NOs:1-23, wherein any such molecule that is 10 to 30 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected
15 from the group consisting of *Ralstonia solanacearum*, *Sinorhizobium meliloti*, *Homo sapiens*, *Mesorhizobium loti*, *Oryza sativa*, *Drosophila melanogaster*, *Rhizobium leguminosarum*, *Xylella fastidiosa*, *Deinococcus radiodurans*, *Achromobacter cycloclastes*, *Candida cylindracea*, *Streptomyces lavendulae*, *Streptococcus pneumoniae*, *Mycobacterium tuberculosis*, *Pseudomonas aeruginosa*, *Sus scrofa*, *Mycobacterium leprae*,
20 *Streptomyces coelicolor*, *Pseudomonas sp.*, *Thauera aromatica*, *Brucella melitensis*, *Streptomyces noursei*, *Rhizobium meliloti*, *Synechococcus elongates*, *Rhodobacter capsulatus*, *Agrobacterium tumefaciens*, *Mycobacterium smegmatis*, *Drosophila virilis*, *Mus musculus*, *Leishmania major*, *Botrytis cinerea*, *Caulobacter crescentus*, *Rhodobacter sphaeroides*, *Spermatozopsis similes*, *Giardia intestinalis*,
25 *Triticum aestivum*, *Bovine herpesvirus*, *Streptomyces sp.*, *Streptomyces peucetius*, *Rhizobium sp.*, *Haloferax volcanii*, *Streptomyces viridochromogenes*, *Felis catus*, *Xanthomonas campestris*, *Thermotoga maritime*, *Thermotoga neapolitana*, *Frankia alni*, *Halobacterium NRC-1*, *Glycine max*, *Leishmania tarentolae*, *Neisseria meningitides*, *Escherichia coli*, *Caenorhabditis elegans*, *Leishmania mexicana*, *Zea mays*, *Ictalurid herpesvirus*,
30 *Rattus norvegicus*, *Arabidopsis thaliana*, *Pseudomonas fluorescens*, *Pantoea agglomerans*, *Erwinia uredovora*, *Pantoea ananatis*, *Streptomyces hygroscopicus*,

Rickettsia typhi, *Pseudomonas cruciviae*, *Xanthomonas albilineans*, *Halobacterium salinarium*, *Micromonospora griseorubida*, *Pseudomonas paucimobilis*, *Streptomyces lividans*, *Pyrobaculum aerophilum*, *Sinorhizobium meliloti*, *Mesorhizobium loti*, *Bacillus halodurans*, *Trypanosoma rangeli*, *Trypanosoma minasense*, *Trypanosoma leeuwenhoekii*,
 5 and *Brassica napus* using an appropriate third nucleic acid molecule.

The invention provides for an isolated nucleic acid comprising a nucleic acid molecule of 10 nucleotides to 200 nucleotides having at least 75% sequence identity to one of the sequences set out in SEQ ID NOs:110-1342 or to the complement of that sequence. Using Table 1 as a reference, any such molecule that is 10 to N nucleotides in
 10 length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms shown in Table 1 corresponding to the respective SEQ ID NO, using an appropriate third
 15 nucleic acid molecule. For example, for SEQ ID NO:110 (segment 26), any such molecule that is 10 to 33 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of *Mus musculus* and *Rhodobacter sphaeroides*, using an appropriate third
 20 nucleic acid molecule.

Table 1.

Fragment Designation	SEQ ID NO:	N (nt)	Organisms
26	110	33	<i>Mus musculus</i> ; <i>Rhodobacter sphaeroides</i>
27	111	38	<i>Novosphingobium aromaticivorans</i> ; <i>Corynebacterium efficiens</i>
28	112	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
29	113	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
30	114	32	<i>Brucella melitensis</i> ; <i>Brucella suis</i>
31	115	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
32	116	32	<i>Galleria mellonella</i>
33	117	32	<i>Oryctolagus cuniculus</i> ; <i>Novosphingobium aromaticivorans</i>
35	118	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
36	119	38	<i>Oryza sativa</i> ; <i>Burkholderia fungorum</i>
37	120	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
38	121	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
39	122	39	<i>Magnetospirillum magnetotacticum</i> ; <i>Zea mays</i> ; <i>Oryza</i>

			<i>sativa; Streptomyces coelicolor</i>
40	123	32	<i>Neurospora crassa</i>
41	124	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
47	125	33	<i>Ralstonia solanacearum</i>
48	126	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
56	127	42	<i>Halobacterium</i> sp. NRC-1; <i>Oryza sativa</i>
57	128	32	<i>Mus musculus; Arabidopsis thaliana</i>
58	129	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
59	130	38	<i>Ralstonia metallidurans; Magnetospirillum magnetotacticum</i>
60	131	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
61	132	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
62	133	36	<i>Ralstonia metallidurans</i>
63	134	38	<i>Leishmania donovani; Oryza sativa</i>
67	135	32	<i>Oryza sativa</i>
68	136	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
69	137	33	<i>Mus musculus; Archaeoglobus fulgidus</i>
70	138	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
71	139	32	<i>Corynebacterium efficiens</i>
72	140	45	<i>Pseudomonas aeruginosa</i>
73	141	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
74	142	41	<i>Rhodospirillum rubrum; Ralstonia eutropha</i>
75	143	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
76	144	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
77	145	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
79	146	32	<i>Actinosynnema pretiosum</i> subsp. <i>auranticum maytansino</i>
80	147	44	<i>Streptomyces coelicolor; Homo sapiens; Rhodopseudomonas palustris; Triticum aestivum</i>
81	148	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
82	149	41	<i>Oryza sativa; Spermatozopsis similis</i>
83	150	32	<i>Streptomyces coelicolor</i>
85	151	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
86	152	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
87	153	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
88	154	32	<i>Ralstonia solanacearum</i>
89	155	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
90	156	33	<i>Pseudomonas</i> sp.; <i>Chlorobium tepidum; Pseudomonas aeruginosa</i>
91	157	38	<i>Homo sapiens; Lentinus edodes; Geobacter metallireducens; Thauera aromatica; Oryza sativa</i>
92	158	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
93	159	32	<i>Chlamydomonas geitleri</i>
94	160	45	<i>Streptomyces lavendulae</i>
95	161	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
96	162	32	<i>Xanthomonas campestris; Xanthomonas axonopodis</i>
97	163	32	<i>Homo sapiens</i>
98	164	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
99	165	32	<i>Ralstonia solanacearum</i>
100	166	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>

101	167	47	<i>Mus musculus</i> ; <i>Mycobacterium avium</i> ; <i>Homo sapiens</i> ; <i>Pseudomonas pseudoalcaligenes</i>
102	168	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>
103	169	32	<i>Oryctolagus cuniculus</i>
104	170	30	<i>Mycobacterium avium</i> subsp. <i>avium</i>

With respect to the organisms identified in Table 1, some of them represent multiple species, subspecies, or strains. To test whether or not particular reagents distinguish between *M. paratuberculosis* and such species, subspecies, or strains, it may be desirable to test a representative number of species, subspecies, or strains, respectively. In cases where the genetic variation is minimal within the species, subspecies, or strains, it may not be necessary to test more than one or two species, subspecies, or strains, respectively. In other cases, multiple species, subspecies, or strains may need to be tested, although initial testing can focus on the most genetically distant species, subspecies, or strains, respectively.

In another aspect, the invention provides for vectors comprising a nucleic acid of the invention. Host cells comprising such a vector are further provided by the invention.

In yet another aspect, the invention provides for isolated polypeptides encoded by the nucleic acids of the invention. For example, the nucleic acid molecule having the sequence of SEQ ID NO:1 can encode a polypeptide having an amino acid sequence of SEQ ID NO:24; the nucleic acid molecule having the sequence of SEQ ID NO:2 can encode a polypeptide having an amino acid sequence of SEQ ID NO:25; the nucleic acid molecule having the sequence of SEQ ID NO:3 can encode a polypeptide having an amino acid sequence of SEQ ID NO:26; the nucleic acid molecule having the sequence of SEQ ID NO:4 can encode a polypeptide having an amino acid sequence of SEQ ID NO:27; the nucleic acid molecule having the sequence of SEQ ID NO:5 can encode a polypeptide having an amino acid sequence of SEQ ID NO:28; the nucleic acid molecule having the sequence of SEQ ID NO:6 can encode a polypeptide having an amino acid sequence of SEQ ID NO:29; the nucleic acid molecule having the sequence of SEQ ID NO:7 can encode a polypeptide having an amino acid sequence of SEQ ID NO:30; the

nucleic acid molecule having the sequence of SEQ ID NO:8 can encode a polypeptide having an amino acid sequence of SEQ ID NO:31; the nucleic acid molecule having the sequence of SEQ ID NO:9 can encode a polypeptide having an amino acid sequence of SEQ ID NO:32; the nucleic acid molecule having the sequence of SEQ ID NO:10 can
5 encode a polypeptide having an amino acid sequence of SEQ ID NO:33; the nucleic acid molecule having the sequence of SEQ ID NO:11 can encode a polypeptide having an amino acid sequence of SEQ ID NO:34; the nucleic acid molecule having the sequence of SEQ ID NO:12 can encode a polypeptide having an amino acid sequence of SEQ ID NO:35; the nucleic acid molecule having the sequence of SEQ ID NO:13 can encode a
10 polypeptide having an amino acid sequence of SEQ ID NO:36; the nucleic acid molecule having the sequence of SEQ ID NO:14 can encode a polypeptide having an amino acid sequence of SEQ ID NO:37; the nucleic acid molecule having the sequence of SEQ ID NO:15 can encode a polypeptide having an amino acid sequence of SEQ ID NO:38; the nucleic acid molecule having the sequence of SEQ ID NO:16 can encode a polypeptide
15 having an amino acid sequence of SEQ ID NO:39; the nucleic acid molecule having the sequence of SEQ ID NO:17 can encode a polypeptide having an amino acid sequence of SEQ ID NO:40; the nucleic acid molecule having the sequence of SEQ ID NO:18 can encode a polypeptide having an amino acid sequence of SEQ ID NO:41; the nucleic acid molecule having the sequence of SEQ ID NO:19 can encode a polypeptide having an
20 amino acid sequence of SEQ ID NO:42; the nucleic acid molecule having the sequence of SEQ ID NO:20 can encode a polypeptide having an amino acid sequence of SEQ ID NO:43; the nucleic acid molecule having the sequence of SEQ ID NO:21 can encode a polypeptide having an amino acid sequence of SEQ ID NO:44; and the nucleic acid molecule having the sequence of SEQ ID NO:22 can encode a polypeptide having an
25 amino acid sequence of SEQ ID NO:45.

In another aspect, the invention provides articles of manufacture that include one or more polypeptides of the invention. In still another aspect of the invention, there are provided antibodies that have specific binding affinity for a polypeptide of the invention.

In another aspect, the invention provides for methods for detecting the presence or
30 absence of *M. paratuberculosis* in a biological sample. Such methods include contacting the biological sample with one or more of the nucleic acids of the invention (e.g., SEQ ID

NOs:1-23 and 110-1342) under standard amplification conditions, wherein an amplification product is produced if *M. paratuberculosis* nucleic acid is present in the biological sample; and detecting the presence or absence of the amplification product. Generally, the presence of the amplification product indicates the presence of *M. paratuberculosis* in the biological sample, and the absence of the amplification product indicates the absence of *M. paratuberculosis* in the biological sample. Representative animals from which the biological sample can be derived include a cow, a sheep, a goat, a rabbit, a deer, an antelope, a bison, or a human. Representative biological samples include a fecal sample and a milk sample. Further, representative nucleic acids that can be used in the above-described methods include those having the sequence of SEQ ID NO:46-101 and 1343-1354.

In another aspect, the invention provides methods for detecting the presence or absence of *M. paratuberculosis* in a biological sample. Such methods include contacting the biological sample with one or more of the nucleic acids of the invention (*e.g.*, SEQ ID NOs:1-23 and 110-1342) under hybridization conditions, wherein a hybridization complex is produced if *M. paratuberculosis* nucleic acid molecules are present in the biological sample; and detecting the presence or absence of the hybridization complex. Generally, the presence of the hybridization complex indicates the presence of *M. paratuberculosis* in the biological sample, and the absence of the hybridization complex indicates the absence of *M. paratuberculosis* in the biological sample. Typically, nucleic acids present in the biological sample are electrophoretically separated. Such electrophoretically separated nucleic acids can be attached to a solid support. Representative solid supports include nylon membranes and nitrocellulose membranes. Further, one or more nucleic acids can be labeled. Representative biological samples include a fecal sample, a milk sample, and a blood sample.

In another aspect, the invention provides methods for detecting the presence or absence of *M. paratuberculosis* in a biological sample. Such methods include contacting the biological sample with a polypeptide of the invention (*e.g.*, SEQ ID NOs:24-45), wherein a polypeptide-antibody complex is produced if an antibody having specific binding affinity for the polypeptide is present in the sample; and detecting the presence or absence of the polypeptide-antibody complex. Typically, the presence of the

polypeptide-antibody complex indicates the presence of *M. paratuberculosis* in the biological sample, and the absence of the polypeptide-antibody complex indicates the absence of *M. paratuberculosis* in the biological sample. Polypeptides used in the above-described method can be attached to a solid support. Further, representative biological samples include a blood sample and a milk sample.

In yet another aspect, the invention provides for methods for detecting the presence or absence of *M. paratuberculosis* in a biological sample. Such methods include contacting the biological sample with an antibody of the invention (*e.g.*, an antibody having specific binding affinity for a polypeptide having an amino acid sequence of SEQ ID NOs:24-45), wherein an antibody-polypeptide complex is produced if a polypeptide is present in the biological sample for which the antibody has specific binding affinity, and detecting the presence or absence of the antibody-polypeptide complex. Generally, the presence of the antibody-polypeptide complex indicates the presence of *M. paratuberculosis* in the biological sample, and the absence of the antibody-polypeptide complex indicates the absence of *M. paratuberculosis* in the biological sample. Antibodies used in the above-described methods can be bound to a solid support. Representative biological samples that can be used in the above-described methods include a blood sample and a milk sample.

In still another aspect of the invention, there are provided methods of preventing infection by *M. paratuberculosis* in an animal. Such methods include administering a compound to the animal, wherein the compound comprises a polypeptide of the invention (*e.g.*, SEQ ID NOs:24-45). Alternatively, such methods include administering a compound to the animal, wherein the compound comprises a nucleic acid of the invention (*e.g.*, a nucleic acid comprising a nucleic acid molecule having at least 75% sequence identity to SEQ ID NOs:1-23, 110-1341, or 1342). Typically, the compound immunizes the animal against *M. paratuberculosis*.

In another aspect of the invention, there is provided a composition comprising a first oligonucleotide primer and a second oligonucleotide primer, wherein the first oligonucleotide primer and the second oligonucleotide primer are each 10 to 50 nucleotides in length, and wherein the first and second oligonucleotide primers, in the presence of *M. paratuberculosis* nucleic acid, generate an amplification product under

standard amplification conditions, but do not generate an amplification product in the presence of *M. avium* subsp. *avium* nucleic acid. The invention further provides for an article of manufacture comprising such a composition.

5 In yet another aspect of the invention, there is provided an isolated nucleic acid, wherein the nucleic acid comprises a nucleic acid molecule greater than 10 nucleotides in length. Such a molecule has at least 75% sequence identity to SEQ ID NO:1355 or to the complement of SEQ ID NO:1355, and hybridizes under stringent conditions with *M. paratuberculosis* nucleic acid but does not hybridize with *M. avium* subsp. *avium* nucleic acid under the same hybridization conditions. Any of the sequences disclosed herein
10 (e.g., SEQ ID NOs:1-23, 110-1341, or 1342) can be used to design one or more oligonucleotide primers.

In still another aspect of the invention, there is provided articles of manufacture. Articles of manufacture of the invention can include one or more isolated nucleic acids of the invention.

15 In yet another aspect of the invention, the reagents and methods disclosed herein are used by a diagnostic service provider (e.g., a diagnostic testing laboratory) to obtain and report test results. For example, a provider could send out, or otherwise provide, a collection vial or other container to a customer (recipient) desiring the provider's diagnostic testing services. The container can be part of a collection kit including sterile
20 plastic ware components, for example. The collection kit further can include instructions for collecting a biological sample (e.g., feces, or milk), and for returning the container, with the sample, to the provider. Upon return to the provider, the provider can perform a diagnostic assay on the sample using the reagents and methods disclosed herein. Following completion of the assay, the provider can send or otherwise communicate
25 results of the assay to the recipient.

Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention pertains. Although methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present invention, suitable
30 methods and materials are described below. In addition, the materials, methods, and examples are illustrative only and not intended to be limiting. All publications, patent

applications, patents, and other references mentioned herein are incorporated by reference in their entirety. In case of conflict, the present specification, including definitions, will control.

5 The details of one or more embodiments of the invention are set forth in the accompanying drawings and the description below. Other features, objects, and advantages of the invention will be apparent from the drawings and detailed description, and from the claims.

DESCRIPTION OF DRAWINGS

10 Figure 1 is a sequence alignment schematic showing positions of predicted coding sequences relative to assembled contig fragments. Alignments of contig 1614 and a trimmed fragment of the 94-kb contig 1398 are shown along with each predicted coding sequence listed in Table 4. Note that the core region of genes 250 to 257 is well separated from neighboring coding regions. The integrase gene upstream of gene 250 is
15 also designated gene 249.

Figure 2 shows the sequences of *M. paratuberculosis*-specific nucleic acid molecules (SEQ ID NOs:1-23).

Figure 3 shows the polypeptide sequences (SEQ ID NOs:24-45) encoded by *M. paratuberculosis*-specific nucleic acids. An * indicates a stop codon.

20 Figure 4 shows representative nucleic acid molecules having 75%, 80%, 85%, 90%, 95%, and 99% sequence identity to SEQ ID NO:1 (SEQ ID NOs:102-107, respectively).

Figure 5 is a map of the *M. paratuberculosis* genome, showing the relative positions of novel sequences.

25 Figure 6 shows the sequences of *M. paratuberculosis*-specific nucleic acid molecules (SEQ ID NOs:110-1342).

DETAILED DESCRIPTION

30 The close genetic relationship between *M. paratuberculosis* and *M. avium* has made difficult the identification of nucleic acids and polypeptides specific to *M.*

paratuberculosis that can be used with high sensitivity and specificity to detect *M. paratuberculosis*. The present invention provides nucleic acid molecules that are unique to *M. paratuberculosis*. The invention also provides the *M. paratuberculosis*-specific polypeptides encoded by the nucleic acid molecules of the invention, and antibodies
5 having specific binding affinity for the *M. paratuberculosis*-specific polypeptides. The nucleic acid molecules, polypeptides, and antibodies of the invention can be used in methods of the invention to detect *M. paratuberculosis* in a sample. The invention additionally provides methods of preventing a *M. paratuberculosis* infection in an animal.

10 *Isolated M. paratuberculosis-specific nucleic acid molecules*

The present invention is based, in part, on the identification of nucleic acid molecules that are unique to *M. paratuberculosis*. These nucleic acid molecules are herein referred to as "*M. paratuberculosis*-specific" nucleic acid molecules. Particular nucleic acid molecules of the invention include the sequences shown in SEQ ID NOs:1-
15 23 and 110-1342. As used herein, the term "nucleic acid molecule" can include DNA molecules and RNA molecules and analogs of the DNA or RNA molecule generated using nucleotide analogs. A nucleic acid molecule of the invention can be single-stranded or double-stranded, and the strandedness will depend upon its intended use.

The invention further encompasses nucleic acid molecules that differ from the
20 nucleotide sequence of SEQ ID NOs:1-23 and 110-1342. Nucleic acid molecules of the invention include molecules that are at least 10 nucleotides in length and that have at least 75% sequence identity (*e.g.*, at least 80%, 85%, 90%, 95%, or 99% sequence identity) to any of SEQ ID NOs:1-23 and 110-1342. The full-length sizes of each of the novel *M. paratuberculosis*-specific nucleic acid molecules having the sequences shown in SEQ ID
25 NOs:1-23 are indicated in Table 2. Nucleic acid molecules that differ in sequence from the nucleic acid sequences shown in SEQ ID NOs:1-23 and 110-1342 can be generated by standard techniques, such as site-directed mutagenesis or PCR-mediated mutagenesis. In addition, nucleotide changes can be introduced randomly along all or part of the *M. paratuberculosis*-specific nucleic acid molecule, such as by saturation mutagenesis.
30 Alternatively, nucleotide changes can be introduced into a sequence by chemically synthesizing a nucleic acid molecule having such changes.

Table 2
 Sizes of *M. paratuberculosis*-specific nucleic acid molecules and polypeptides

Gene	Nucleic Acid (bp)	SEQ ID NO:	Polypeptide (amino acids)	SEQ ID NO:
10	969	1	322	24
11	576	2	191	25
38	522	3	173	26

256	426	21	141	44
257	279	22	87	45

5 In calculating percent sequence identity, two sequences are aligned and the number of identical matches of nucleotides or amino acid residues between the two sequences is determined. The number of identical matches is divided by the length of the aligned region (*i.e.*, the number of aligned nucleotides or amino acid residues) and multiplied by 100 to arrive at a percent sequence identity value. It will be appreciated that the length of the aligned region can be a portion of one or both sequences up to the full-length size of the shortest sequence. It will be appreciated that a single sequence can align differently with other sequences and hence, can have different percent sequence identity values over each aligned region. It is noted that the percent identity value is usually rounded to the nearest integer. For example, 78.1%, 78.2%, 78.3%, and 78.4% are rounded down to 78%, while 78.5%, 78.6%, 78.7%, 78.8%, and 78.9% are rounded

up to 79%. It is also noted that the length of the aligned region is always an integer.

The alignment of two or more sequences to determine percent sequence identity is performed using the algorithm described by Altschul et al. (1997, *Nucleic Acids Res.*, 25:3389-3402) as incorporated into BLAST (basic local alignment search tool) programs, available at <http://www.ncbi.nlm.nih.gov>. BLAST searches can be performed to determine percent sequence identity between a *M. paratuberculosis*-specific nucleic acid molecule of the invention and any other sequence or portion thereof aligned using the Altschul et al. algorithm. BLASTN is the program used to align and compare the identity between nucleic acid sequences, while BLASTP is the program used to align and compare the identity between amino acid sequences. When utilizing BLAST programs to calculate the percent identity between a sequence of the invention and another sequence, the default parameters of the respective programs are used. Sequence analysis of the *M. paratuberculosis*-specific nucleic acid sequences as performed herein used BLAST version 2.2.2 (updated on December 14, 2001).

The sequences of representative nucleic acids of the invention having 75%, 80%, 85%, 90%, 95%, and 99% sequence identity to SEQ ID NO:1 are shown in Figure 4 (SEQ ID NOs:102-107, respectively). Such sequences can be generated using a computer or by hand. The nucleic acid sequences shown in SEQ ID NOs:102-107 were generated by hand by randomly changing 25 nucleotides out of every 100 nucleotides of SEQ ID NO:1, 2 out of every 10, 15 out of every 100, 1 out of every 10, 5 out of every 100, or 1 nucleotide out of every 100 nucleotides of SEQ ID NO:1, respectively. By "changing," it is meant that the nucleotide at a particular position is replaced randomly with one of the other three nucleotides. It is apparent to those of ordinary skill in the art that any nucleic acid molecule within the scope of the invention can be generated using the same method described herein (*i.e.*, by similarly changing nucleotides within the sequence of SEQ ID NOs:1-23 or 110-1342).

Nucleic acid molecules of the invention between about 10 and about 30 nucleotides in length will, under standard amplification conditions, generate an amplification product in the presence of *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule (*e.g.*, an oligonucleotide primer that specifically anneals to *M. paratuberculosis* nucleic acid) but will not generate an amplification

product in the presence of nucleic acid from an organism other than *M. paratuberculosis* using an appropriate third nucleic acid molecule (e.g., an oligonucleotide primer that specifically anneals to nucleic acid from the other organism). As used herein, "standard amplification conditions" refer to the basic components of an amplification reaction mix, and cycling conditions that include multiple cycles of denaturing the template nucleic acid, annealing the oligonucleotide primers to the template nucleic acid, and extension of the primers by the polymerase to produce an amplification product (see, for example, U.S. Patent Nos. 4,683,195; 4,683,202; 4,800,159; and 4,965,188). The basic components of an amplification reaction mix generally include, for example, about 10-25 nmole of each of the four deoxynucleoside triphosphates, (e.g., dATP, dCTP, dTTP, and dGTP, or analogs thereof), 10-100 pmol of primers, template nucleic acid, and a polymerase enzyme. The reaction components are generally suspended in a buffered aqueous solution having a pH of between about 7 and about 9. The aqueous buffer can further include one or more co-factors (e.g., Mg^{2+} , K^{+}) required by the polymerase. Additional components such as DMSO are optional. Template nucleic acid is typically denatured at a temperature of at least about 90°C, and extension from primers is typically performed at a temperature of at least about 72°C.

The annealing temperature can be used to control the specificity of amplification. The temperature at which primers anneal to template nucleic acid must be below the T_m of each of the primers, but high enough to avoid non-specific annealing of primers to the template nucleic acid. The T_m is the temperature at which half of the DNA duplexes have separated into single strands, and can be predicted for an oligonucleotide primer using the formula provided in section 11.46 of Sambrook et al. (1989, *Molecular Cloning: A Laboratory Manual*, 2nd Ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, New York). Non-specific amplification products are detected as bands on a gel that are not the size expected for the correct amplification product. The annealing temperature used in amplification reactions described herein to demonstrate that the claimed nucleic acid molecules are *M. paratuberculosis*-specific was 55°C and 60°C for nucleic acids isolated from bacteria or from a biological sample, respectively. It can be appreciated by those of skill in the art that appropriate positive and negative controls should be performed with every set of amplification reactions to avoid uncertainties

related to contamination and/or non-specific annealing of oligonucleotide primers and extension therefrom.

An appropriate second nucleic acid molecule is generally an oligonucleotide primer that specifically anneals to *M. paratuberculosis* nucleic acid, and that can act in combination with a nucleic acid molecule of the invention, specifically for example a 10- to 30-, or 40-, or 50-nucleotide-long nucleic acid molecule of the invention, under appropriate amplification conditions to generate an amplification product in the presence of *M. paratuberculosis* nucleic acid. In order for a second nucleic acid molecule to act in combination with a nucleic acid molecule of the invention to generate an amplification product, the two molecules must anneal to opposite strands of the template nucleic acid, and should be an appropriate distance from one another such that the polymerase can effectively polymerize across the region and such that the amplification product can be readily detected using, for example, electrophoresis. Oligonucleotide primers can be designed using, for example, a computer program such as OLIGO (Molecular Biology Insights Inc., Cascade, CO) to assist in designing primers that have similar melting temperatures. Typically, oligonucleotide primers are 10 to 30 or 40 or 50 nucleotides in length (e.g., 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, or 50 nucleotides in length), but can be longer or shorter if appropriate amplification conditions are used.

Representative pairs of oligonucleotide primers that were used to amplify each of the *M. paratuberculosis*-specific nucleic acid molecules of the invention are shown in Tables 3, 6, and 12 (SEQ ID NOs:46-101 and 1343-1354). Alternatively, the nucleic acid molecules having the sequences shown in SEQ ID NOs:1-23 and 110-1342 can be used to design a pair of oligonucleotide primers. Oligonucleotides of the invention can be obtained by restriction enzyme digestion of *M. paratuberculosis*-specific nucleic acid molecules or can be prepared by standard chemical synthesis and other known techniques.

As used herein, an organism other than *M. paratuberculosis* refers to any organism that is not *M. paratuberculosis*. Generally, only relevant organisms are used in amplification reactions to examine the specificity of a 10 or more nucleotide-long nucleic acid molecule of the invention. Particularly relevant organisms include, without

limitation, *Ralstonia solanacearum*, *Sinorhizobium meliloti*, *Homo sapiens*,
Mesorhizobium loti, *Oryza sativa*, *Drosophila melanogaster*, *Rhizobium leguminosarum*,
Xylella fastidiosa, *Deinococcus radiodurans*, *Achromobacter cycloclastes*, *Candida*
cylindracea, *Streptomyces lavendulae*, *Streptococcus pneumoniae*, *Mycobacterium*
 5 *tuberculosis*, *Pseudomonas aeruginosa*, *Sus scrofa*, *Mycobacterium leprae*, *Streptomyces*
coelicolor, *Pseudomonas* sp. (e.g., strain CA-10), *Thauera aromatica*, *Brucella*
melitensis, *Streptomyces noursei*, *Rhizobium meliloti*, *Synechococcus elongates*,
Rhodobacter capsulatus, *Agrobacterium tumefaciens*, *Mycobacterium smegmatis*,
Drosophila virilis, *Mus musculus*, *Leishmania major*, *Botrytis cinerea*, *Caulobacter*
 10 *crescentus*, *Rhodobacter sphaeroides*, *Spermatozopsis similes*, *Giardia intestinalis*,
Triticum aestivum, *Bovine herpesvirus*, *Streptomyces* sp. (e.g., strain MA-6548),
Streptomyces peucetius, *Rhizobium* sp. (e.g., strain NGR-234), *Haloferax volcanii*,
Streptomyces viridochromogenes, *Felis catus*, *Xanthomonas campestris*, *Thermotoga*
maritime, *Thermotoga neapolitana*, *Frankia alni*, *Halobacterium* NRC-1 (ATCC
 15 Accession No. 700922), *Glycine max*, *Leishmania tarentolae*, *Neisseria meningitidis*,
Escherichia coli, *Caenorhabditis elegans*, *Leishmania mexicana*, *Zea mays*, *Ictalurid*
herpesvirus, *Rattus norvegicus*, *Arabidopsis thaliana*, *Pseudomonas fluorescens*, *Pantoea*
agglomerans, *Erwinia uredovora*, *Pantoea ananatis*, *Streptomyces hygroscopicus*,
Rickettsia typhi, *Pseudomonas cruciviae*, *Xanthomonas albilineans*, *Halobacterium*
 20 *salinarium*, *Micromonospora griseorubida*, *Pseudomonas paucimobilis*, *Streptomyces*
lividans, *Pyrobaculum aerophilum*, *Sinorhizobium meliloti*, *Mesorhizobium loti*, *Bacillus*
halodurans, *Trypanosoma rangeli*, *Trypanosoma minasense*, *Trypanosoma leeuwenhoekii*,
 and *Brassica napus*. A 10 or more nucleotide-long nucleic acid molecule of the invention
 in combination with an appropriate third nucleic acid molecule (e.g., a third
 25 oligonucleotide primer) will not generate an amplification product from nucleic acid of
 one or more of these other organisms.

As used herein, an "isolated" nucleic acid molecule is a nucleic acid molecule that
 is separated from other nucleic acid molecules that are usually associated with the
 isolated nucleic acid molecule. Thus, an "isolated" nucleic acid molecule includes,
 30 without limitation, a nucleic acid molecule that is free of sequences that naturally flank
 one or both ends of the nucleic acid in the genome of the organism from which the

isolated nucleic acid is derived (*e.g.*, a cDNA or genomic DNA fragment produced by PCR or restriction endonuclease digestion). Such an isolated nucleic acid molecule is generally introduced into a vector (*e.g.*, a cloning vector, or an expression vector) for convenience of manipulation or to generate a fusion nucleic acid molecule. In addition,
5 an isolated nucleic acid molecule can include an engineered nucleic acid molecule such as a recombinant or a synthetic nucleic acid molecule. A nucleic acid molecule existing among hundreds to millions of other nucleic acid molecules within, for example, a nucleic acid library (*e.g.*, a cDNA, or genomic library) or a portion of a gel (*e.g.*, agarose, or polyacrylamine) containing restriction-digested genomic DNA is not to be considered
10 an isolated nucleic acid.

Isolated nucleic acid molecules of the invention can be obtained using techniques routine in the art. For example, isolated nucleic acids within the scope of the invention can be obtained using any method including, without limitation, recombinant nucleic acid technology, and/or the polymerase chain reaction (PCR). General PCR techniques are
15 described, for example in *PCR Primer: A Laboratory Manual*, Dieffenbach & Dveksler, Eds., Cold Spring Harbor Laboratory Press, 1995. Recombinant nucleic acid techniques include, for example, restriction enzyme digestion and ligation, which can be used to isolate a nucleic acid molecule of the invention. Isolated nucleic acids of the invention also can be chemically synthesized, either as a single nucleic acid molecule or as a series
20 of oligonucleotides. In addition, isolated nucleic acid molecules of the invention also can be obtained by mutagenesis. For example, an isolated nucleic acid that shares identity with an art known *M. paratuberculosis*-specific nucleic acid sequence can be mutated using common molecular cloning techniques (*e.g.*, site-directed mutagenesis). Possible mutations include, without limitation, deletions, insertions, substitutions, and
25 combinations thereof.

Vectors containing *M. paratuberculosis*-specific nucleic acid molecules also are provided by the invention. Vectors, including expression vectors, suitable for use in the present invention are commercially available and/or produced by recombinant DNA technology methods routine in the art. A vector containing a *M. paratuberculosis*-
30 specific nucleic acid molecule can have elements necessary for expression operably linked to such a *M. paratuberculosis*-specific nucleic acid, and further can include

sequences such as those encoding a selectable marker (*e.g.*, an antibiotic resistance gene), and/or those that can be used in purification of a *M. paratuberculosis*-specific polypeptide (*e.g.*, 6xHis tag).

5 Elements necessary for expression include nucleic acid sequences that direct and regulate expression of nucleic acid coding sequences. One example of an element necessary for expression is a promoter sequence, for example, a *M. paratuberculosis*-specific promoter (*e.g.*, from the same coding sequence being expressed or from a different coding sequence) or a non-*M. paratuberculosis*-specific promoter. Elements necessary for expression also can include introns, enhancer sequences, response elements,
10 or inducible elements that modulate expression of a *M. paratuberculosis*-specific nucleic acid. Elements necessary for expression can be of bacterial, yeast, insect, mammalian, or viral origin and vectors can contain a combination of elements from different origins. Elements necessary for expression are described, for example, in Goeddel, 1990, *Gene Expression Technology: Methods in Enzymology*, 185, Academic Press, San Diego, CA.
15 As used herein, operably linked means that a promoter and/or other regulatory element(s) are positioned in a vector relative to a *M. paratuberculosis*-specific nucleic acid in such a way as to direct or regulate expression of the *M. paratuberculosis*-specific nucleic acid. Many methods for introducing nucleic acids into cells, both *in vivo* and *in vitro*, are well known to those skilled in the art and include, without limitation, calcium phosphate
20 precipitation, electroporation, heat shock, lipofection, microinjection, and viral-mediated nucleic acid transfer.

Another aspect of the invention pertains to host cells into which a vector of the invention, *e.g.*, an expression vector, or an isolated nucleic acid molecule of the invention has been introduced. The term "host cell" refers not only to the particular cell but also to
25 the progeny or potential progeny of such a cell. A host cell can be any prokaryotic or eukaryotic cell. For example, *M. paratuberculosis*-specific nucleic acids can be expressed in bacterial cells such as *E. coli*, or in insect cells, yeast or mammalian cells (such as Chinese hamster ovary cells (CHO) or COS cells). Other suitable host cells are known to those skilled in the art.

30 Vectors containing representative nucleic acid molecules unique to *M. paratuberculosis* were deposited with the American Type Culture Collection (ATCC),

10801 University Boulevard Manassas, VA 20110, on April 3, 2002, and assigned
Accession Numbers PTA-4199, and PTA-4200. Each deposit will be maintained under
the terms of the Budapest Treaty on the International Recognition of the Deposit of
Microorganisms for the Purposes of Patent Procedure. This deposit was made merely as a
5 convenience for those of skill in the art and is not an admission that a deposit is required
under 35 U.S.C. §112.

Purified M. paratuberculosis polypeptides

One aspect of the invention pertains to purified *M. paratuberculosis*-specific
10 polypeptides, as well as polypeptide fragments. A "*M. paratuberculosis*-specific
polypeptide" refers to a polypeptide encoded by a nucleic acid molecule that is unique to
M. paratuberculosis (e.g., *M. paratuberculosis*-specific nucleic acid molecules, for
example, those having the sequence shown in SEQ ID NOs:1-23 and 110-1342).
Predicted amino acid sequences encoded by novel *M. paratuberculosis*-specific nucleic
15 acids of the invention are shown in SEQ ID NOs:24-45.

The term "purified" polypeptide as used herein refers to a polypeptide that has
been separated or purified from cellular components that naturally accompany it.
Typically, the polypeptide is considered "purified" when it is at least 70% (e.g., at least
75%, 80%, 85%, 90%, 95%, or 99%) by dry weight, free from the proteins and naturally
20 occurring molecules with which it is naturally associated. Since a polypeptide that is
chemically synthesized is, by nature, separated from the components that naturally
accompany it, a synthetic polypeptide is "purified."

M. paratuberculosis-specific polypeptides can be purified from natural sources
(e.g., a biological sample) by known methods such as DEAE ion exchange, gel filtration,
25 and hydroxyapatite chromatography. A purified *M. paratuberculosis*-specific
polypeptide also can be obtained by expressing a *M. paratuberculosis*-specific nucleic
acid in an expression vector, for example. In addition, a purified *M. paratuberculosis*-
specific polypeptide can be obtained by chemical synthesis. The extent of purity of a *M.*
paratuberculosis-specific polypeptide can be measured using any appropriate method,
30 e.g., column chromatography, polyacrylamide gel electrophoresis, or HPLC analysis.

In addition to naturally-occurring *M. paratuberculosis*-specific polypeptides, the skilled artisan will further appreciate that changes can be introduced into a nucleic acid molecule (*e.g.*, those having the sequence shown in SEQ ID NOs:1-23, 110-1341, or 1342) as discussed herein, thereby leading to changes in the amino acid sequence of the encoded polypeptide. For example, changes can be introduced into *M. paratuberculosis*-specific nucleic acid coding sequences leading to conservative and/or non-conservative amino acid substitutions at one or more amino acid residues. A "conservative amino acid substitution" is one in which one amino acid residue is replaced with a different amino acid residue having a similar side chain. Similarity between amino acid residues has been assessed in the art. For example, Dayhoff et al. (1978, in *Atlas of Protein Sequence and Structure*, Vol. 5, Suppl. 3, pp 345-352) provides frequency tables for amino acid substitutions that can be employed as a measure of amino acid similarity. A non-conservative substitution is one in which an amino acid residue is replaced with an amino acid residue that does not have a similar side chain.

The invention also provides for chimeric or fusion polypeptides. As used herein, a "chimeric" or "fusion" polypeptide includes a *M. paratuberculosis*-specific polypeptide operatively linked to a heterologous polypeptide. A heterologous polypeptide can be at either the N-terminus or C-terminus of the *M. paratuberculosis*-specific polypeptide. Within a chimeric or fusion polypeptide, the term "operatively linked" is intended to indicate that the two polypeptides are encoded in-frame relative to one another. In a fusion polypeptide, the heterologous polypeptide generally has a desired property such as the ability to purify the fusion polypeptide (*e.g.*, by affinity purification). A chimeric or fusion polypeptide of the invention can be produced by standard recombinant DNA techniques, and can use commercially available vectors.

A polypeptide commonly used in a fusion polypeptide for purification is glutathione S-transferase (GST), although numerous other polypeptides are available and can be used. In addition, a proteolytic cleavage site can be introduced at the junction between a *M. paratuberculosis*-specific polypeptide and a non-*M. paratuberculosis*-specific polypeptide to enable separation of the two polypeptides subsequent to purification of the fusion polypeptide. Enzymes that cleave such proteolytic sites include Factor Xa, thrombin, or enterokinase. Representative expression vectors encoding a

heterologous polypeptide that can be used in affinity purification of a *M. paratuberculosis* polypeptide include pGEX (Pharmacia Biotech Inc; Smith & Johnson, 1988, *Gene*, 67:31-40), pMAL (New England Biolabs, Beverly, MA) and pRIT5 (Pharmacia, Piscataway, NJ).

5

Anti-M. paratuberculosis-specific antibodies

Another aspect of the invention relates to anti-*M. paratuberculosis*-specific antibodies. The term "anti-*M. paratuberculosis*-specific antibodies" as used herein refers to immunoglobulin molecules and immunologically active portions of immunoglobulin molecules that have specific binding affinity for a *M. paratuberculosis*-specific polypeptide. The invention provides polyclonal and monoclonal antibodies that have specific binding affinity for *M. paratuberculosis*-specific polypeptides. The sequences of numerous *M. paratuberculosis*-specific polypeptides that can be used to generate anti-*M. paratuberculosis*-specific antibodies are disclosed herein (*e.g.*, SEQ ID NOs:24-45).
Examples of immunologically active portions of immunoglobulin molecules include F(ab) and F(ab')₂ fragments, which can be generated by treating an immunoglobulin molecule with an enzyme such as pepsin. As used herein, an antibody that has "specific binding affinity" for a *M. paratuberculosis*-specific polypeptide is an antibody that binds a *M. paratuberculosis*-specific polypeptide but does not bind a non-*M. paratuberculosis*-specific polypeptides. A non-*M. paratuberculosis*-specific polypeptide as used herein refers to a polypeptide that may or may not be found in *M. paratuberculosis*, but is found in at least one other organism besides *M. paratuberculosis*.

A purified *M. paratuberculosis*-specific polypeptide or a fragment thereof can be used as an immunogen to generate polyclonal or monoclonal antibodies that have specific binding affinity for *M. paratuberculosis*-specific polypeptides. Such antibodies can be generated using standard techniques as described herein. Full-length *M. paratuberculosis*-specific polypeptides (see Table 2) or, alternatively, antigenic fragments of *M. paratuberculosis*-specific polypeptides can be used as immunogens. An antigenic fragment of a *M. paratuberculosis*-specific polypeptide usually includes at least 8 (*e.g.*, 10, 15, 20, or 30) amino acid residues of a *M. paratuberculosis*-specific polypeptide (*e.g.*, having the sequence shown in SEQ ID NOs:23-45), and encompasses an epitope of a *M.*

paratuberculosis-specific polypeptide such that an antibody (*e.g.*, polyclonal or monoclonal) raised against the antigenic fragment has specific binding affinity for a *M. paratuberculosis*-specific polypeptide.

Antibodies are typically prepared by first immunizing a suitable animal (*e.g.*, a rabbit, a goat, a mouse or another mammal) with an immunogenic preparation. An appropriate immunogenic preparation can contain, for example, a recombinantly expressed or chemically synthesized *M. paratuberculosis*-specific polypeptide, of a fragment thereof. The preparation can further include an adjuvant, such as Freund's complete or incomplete adjuvant, or similar immunostimulatory agent. Immunization of a suitable animal with an immunogenic *M. paratuberculosis*-specific polypeptide preparation induces a polyclonal anti-*M. paratuberculosis*-specific antibody response.

The titer of the anti-*M. paratuberculosis*-specific antibody in the immunized animal can be monitored over time by standard techniques, such as with an enzyme-linked immunosorbent assay (ELISA) using immobilized *M. paratuberculosis*-specific polypeptides. If desired, the antibody molecules directed against *M. paratuberculosis*-specific polypeptides can be isolated from the animal (*e.g.*, from the blood) and further purified by well-known techniques such as protein A chromatography to obtain the IgG fraction.

At an appropriate time after immunization, *e.g.*, when the anti-*M. paratuberculosis*-specific antibody titers are highest, antibody-producing cells can be obtained from the animal and used to prepare monoclonal antibodies by standard techniques, such as the hybridoma technique originally described by Kohler & Milstein (1975, *Nature*, 256:495-497), the human B cell hybridoma technique (Kozbor et al., 1983, *Immunol. Today*, 4:72), or the EBV-hybridoma technique (Cole et al., 1985, *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, Inc., pp. 77-96). The technology for producing various monoclonal antibody hybridomas is well known (see, generally, *Current Protocols in Immunology*, 1994, Coligan et al. (Eds.), John Wiley & Sons, Inc., New York, NY). Briefly, an immortal cell line (*e.g.*, a myeloma cell line) is fused to lymphocytes (*e.g.*, splenocytes) from an animal immunized with an immunogenic *M. paratuberculosis*-specific polypeptide as described above, and the culture supernatants of the resulting hybridoma cells are screened to identify a hybridoma producing a

monoclonal antibody that has specific binding affinity for the *M. paratuberculosis*-specific polypeptide.

Any of the well-known protocols used for fusing lymphocytes and immortalized cell lines can be applied for the purpose of generating an anti-*M. paratuberculosis*-specific monoclonal antibody (see, e.g., *Current Protocols in Immunology*, supra; Galfre et al., 1977, *Nature*, 266:55052; R.H. Kenneth, in *Monoclonal Antibodies: A New Dimension In Biological Analyses*, Plenum Publishing Corp., New York, New York, 1980; and Lerner, 1981, *Yale J. Biol. Med.*, 54:387-402). Moreover, the ordinary skilled worker will appreciate that there are many variations of such methods that also would be useful. Typically, the immortal cell line is derived from the same species as the lymphocytes. For example, murine hybridomas can be made by fusing lymphocytes from a mouse immunized with an immunogenic preparation with an immortalized mouse cell line, e.g., a myeloma cell line that is sensitive to culture medium containing hypoxanthine, aminopterin and thymidine ("HAT medium"). Any of a number of ATCC-available myeloma cell lines can be used as a fusion partner according to standard techniques, e.g., the P3-NS1/1-Ag4-1, P3-x63-Ag8.653 or Sp2/O-Ag14 myeloma lines. Typically, HAT-sensitive mouse myeloma cells are fused to mouse splenocytes using polyethylene glycol (PEG). Hybridoma cells resulting from the fusion are then selected using HAT medium. Hybridoma cells producing a monoclonal antibody are detected by screening the hybridoma culture supernatants for antibodies that bind *M. paratuberculosis*-specific polypeptides, e.g., using a standard ELISA assay.

As an alternative to preparing monoclonal antibody-secreting hybridomas, an anti-*M. paratuberculosis*-specific monoclonal antibody can be identified and isolated by screening a recombinant combinatorial immunoglobulin library (e.g., an antibody phage display library) with *M. paratuberculosis*-specific polypeptides. Immunoglobulin library members that have specific binding affinity for *M. paratuberculosis*-specific polypeptides can be isolated from such libraries. Kits for generating and screening phage display libraries are commercially available (e.g., the Pharmacia Recombinant Phage Antibody System, Catalog No. 27-9400-01; and the Stratagene SurfZAP Phage Display Kit, Catalog No. 240612). Additionally, examples of methods and reagents particularly amenable for use in generating and screening antibody display libraries can be found in,

for example, U.S. Patent No. 5,223,409; PCT Publication No. WO 92/20791; PCT Publication No. WO 93/01288; Hay et al., 1992, *Hum. Antibod. Hybridomas*, 3:81-85; Griffiths et al., 1993, *EMBO J.*, 12:725-734; and references therein.

5 Additionally, recombinant anti-*M. paratuberculosis*-specific antibodies, such as chimeric and humanized monoclonal antibodies, comprising both human and non-human portions, are within the scope of the invention. Such chimeric and humanized monoclonal antibodies can be produced by recombinant DNA techniques known in the art, for example using methods described in PCT Publication No. WO 87/02671; European Patent (EP) Application 184,187; U.S. Patent No. 4,816,567; Better et al., 1988, 10 *Science*, 240:1041-1043; Shaw et al., 1988, *J. Natl. Cancer Inst.*, 80:1553-1559); U.S. Patent 5,225,539; Verhoeyan et al., 1988, *Science*, 239:1534; Beidler et al., 1988, *J. Immunol.*, 141:4053-4060; and references therein.

An anti-*M. paratuberculosis*-specific antibody (e.g., a monoclonal antibody) can be used to isolate *M. paratuberculosis*-specific polypeptides by standard techniques, such 15 as affinity chromatography or immunoprecipitation. An anti-*M. paratuberculosis*-specific antibody can facilitate the purification of natural *M. paratuberculosis*-specific polypeptides from cells and of recombinantly-produced *M. paratuberculosis*-specific polypeptides expressed in host cells. Moreover, an anti-*M. paratuberculosis*-specific antibody can be used to detect *M. paratuberculosis*-specific polypeptides (e.g., in a 20 cellular lysate or cell supernatant) in order to evaluate the presence or absence of the *M. paratuberculosis*-specific polypeptides. Anti-*M. paratuberculosis*-specific antibodies can be used diagnostically to detect *M. paratuberculosis*-specific polypeptides, and hence, *M. paratuberculosis*, in a biological sample, e.g., to determine the infection status of an animal, or to determine the efficacy of a given treatment regimen.

25

Methods of detecting M. paratuberculosis

The *M. paratuberculosis*-specific nucleic acid molecules and polypeptides, and the anti-*M. paratuberculosis*-specific antibodies described herein can be used in diagnostic assays for the detection of *M. paratuberculosis*. Diagnostic assays for 30 determining the presence or absence of *M. paratuberculosis* are performed using a biological sample (e.g., fecal, blood, milk) to determine whether an animal has been

exposed to or is infected with *M. paratuberculosis*. An exemplary method for detecting the presence or absence of *M. paratuberculosis* in a biological sample involves obtaining a biological sample from an animal and contacting the biological sample with an appropriate agent capable of detecting *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies.

The term "biological sample" is intended to include cells and biological fluids obtained from an animal. In one embodiment, a biological sample contains polypeptides from the animal. Alternatively, the biological sample can contain nucleic acid molecules from the animal, or the biological sample can contain antibodies from the animal. It should be understood that any biological sample in which *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies may be present can be utilized in the methods described herein.

In one embodiment, an agent for detecting the presence or absence of *M. paratuberculosis* in a biological sample is an isolated *M. paratuberculosis*-specific nucleic acid molecule of the invention. The presence of *M. paratuberculosis*-specific nucleic acids in a sample indicates the presence of *M. paratuberculosis* in the sample. Methods for detecting nucleic acids include, for example, PCR and nucleic acid hybridizations (e.g., Southern blot, Northern blot, or *in situ* hybridizations). Specifically, an agent can be one or more oligonucleotides (e.g., oligonucleotide primers) capable of amplifying *M. paratuberculosis*-specific nucleic acids using PCR. PCR methods generally include the steps of collecting a biological sample from an animal, isolating nucleic acid (e.g., DNA, RNA, or both) from the sample, and contacting the nucleic acid with one or more oligonucleotide primers that hybridize(s) with specificity to *M. paratuberculosis*-specific nucleic acid under conditions such that amplification of the *M. paratuberculosis*-specific nucleic acid occurs if *M. paratuberculosis* is present. In the presence of *M. paratuberculosis*, an amplification product corresponding to the *M. paratuberculosis*-specific nucleic acid is produced. Conditions for amplification of a nucleic acid and detection of an amplification product are known to those of skill in the art (see, e.g., *PCR Primer: A Laboratory Manual*, 1995, Dieffenbach & Dveksler, Eds., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY; and U.S. Patent Nos. 4,683,195; 4,683,202; 4,800,159; and 4,965,188). Modifications to the original PCR also

have been developed. For example, anchor PCR, RACE PCR, or ligation chain reaction (LCR) are additional PCR methods known in the art (see, e.g., Landegran et al., 1988, *Science*, 241:1077-1080; and Nakazawa et al., 1994, *Proc. Natl. Acad. Sci. USA*, 91:360-364).

5 Alternatively, an agent for detecting *M. paratuberculosis*-specific nucleic acids can be a labeled oligonucleotide probe capable of hybridizing to *M. paratuberculosis*-specific nucleic acids on a Southern blot. An oligonucleotide probe can be, for example, a *M. paratuberculosis*-specific nucleic acid molecule such as a nucleic acid molecule having the sequence shown in SEQ ID NO:1-22, 110-1341, or 1342, or a fragment
10 thereof. In the presence of *M. paratuberculosis*, a hybridization complex is produced between *M. paratuberculosis* nucleic acid and the oligonucleotide probe. Hybridization between nucleic acid molecules is discussed in detail in Sambrook et al. (1989, *Molecular Cloning: A Laboratory Manual*, 2nd Ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY; Sections 7.37-7.57, 9.47-9.57, 11.7-11.8, and 11.45-11.57).

15 For oligonucleotide probes less than about 100 nucleotides, Sambrook et al. discloses suitable Southern blot conditions in Sections 11.45-11.46. The T_m between a sequence that is less than 100 nucleotides in length and a second sequence can be calculated using the formula provided in Section 11.46. Sambrook et al. additionally discloses prehybridization and hybridization conditions for a Southern blot that uses
20 oligonucleotide probes greater than about 100 nucleotides (see Sections 9.47-9.52). Hybridizations with an oligonucleotide greater than 100 nucleotides generally are performed 15-25°C below the T_m . The T_m between a sequence greater than 100 nucleotides in length and a second sequence can be calculated using the formula provided in Sections 9.50-9.51 of Sambrook et al. Additionally, Sambrook et al. recommends the
25 conditions indicated in Section 9.54 for washing a Southern blot that has been probed with an oligonucleotide greater than about 100 nucleotides.

 The conditions under which membranes containing nucleic acids are prehybridized and hybridized, as well as the conditions under which membranes containing nucleic acids are washed to remove excess and non-specifically bound probe
30 can play a significant role in the stringency of the hybridization. Such hybridizations can be performed, where appropriate, under moderate or high stringency conditions. Such

conditions are described, for example, in Sambrook et al. section 11.45-11.46. For example, washing conditions can be made more stringent by decreasing the salt concentration in the wash solutions and/or by increasing the temperature at which the washes are performed. In addition, interpreting the amount of hybridization can be
5 affected, for example, by the specific activity of the labeled oligonucleotide probe, by the number of probe-binding sites on the template nucleic acid to which the probe has hybridized, and by the amount of exposure of an autoradiograph or other detection medium.

It will be readily appreciated by those of ordinary skill in the art that although any
10 number of hybridization and washing conditions can be used to examine hybridization of a probe nucleic acid molecule to immobilized target nucleic acids, it is more important to examine hybridization of a probe to target nucleic acids, for example, from *M. paratuberculosis* and at least one organism other than *M. paratuberculosis*, under identical hybridization, washing, and exposure conditions. Preferably, the target nucleic
15 acids (e.g., nucleic acids from *M. paratuberculosis* and at least one organism other than *M. paratuberculosis*) are on the same membrane. Representative Southern blot conditions are described in Example 3.

A nucleic acid molecule is deemed to hybridize to *M. paratuberculosis* nucleic acids but not to nucleic acids from an organism other than *M. paratuberculosis* if
20 hybridization to nucleic acid from *M. paratuberculosis* is at least 5-fold (e.g., at least 6-fold, 7-fold, 8-fold, 9-fold, 10-fold, 20-fold, 50-fold, or 100-fold) greater than hybridization to nucleic acid from an organism other than *M. paratuberculosis*. The amount of hybridization can be quantitated directly on a membrane or from an autoradiograph using, for example, a PhosphorImager or a Densitometer (Molecular
25 Dynamics, Sunnyvale, CA). It can be appreciated that useful primers and probes of the invention include primers and probes that anneal and hybridize, respectively, to nucleic acids of organisms other than *M. paratuberculosis* provided that such nucleic acids are not typically present in the relevant test animals. For example, the fact that a particular primer or probe anneals or hybridizes, respectively, to human nucleic acid does not
30 diminish the value of that primer or probe for detecting the presence or absence of *M.*

paratuberculosis in ruminants, since ruminants typically are not contaminated with human nucleic acid.

In addition, anti-*M. paratuberculosis*-specific antibodies provided by the invention can be used as agents to detect the presence or absence of *M. paratuberculosis*-specific polypeptides in a biological sample. The presence of *M. paratuberculosis*-specific polypeptides is an indication of the presence of *M. paratuberculosis* in the sample. Techniques for detecting *M. paratuberculosis*-specific polypeptides include enzyme linked immunosorbent assays (ELISAs), Western blots, immunoprecipitations and immunofluorescence. An antibody of the invention can be polyclonal or monoclonal, and usually is detectably labeled. An antibody having specific binding affinity for a *M. paratuberculosis*-specific polypeptide can be generated using methods described herein. The antibody can be attached to a solid support such as a microtiter plate using methods known in the art (see, for example, Leahy et al., 1992, *BioTechniques*, 13:738-743). In the presence of *M. paratuberculosis*, an antibody-polypeptide complex is formed.

In addition, *M. paratuberculosis*-specific polypeptides of the invention can be used as an agent to detect the presence or absence of anti-*M. paratuberculosis*-specific antibodies in a biological sample. The presence of anti-*M. paratuberculosis*-specific antibodies in a sample indicates that the animal from which the sample was obtained mounted an immune response toward *M. paratuberculosis*. Given the etiology of *M. paratuberculosis* in its host animals, an animal that has detectable levels of anti-*M. paratuberculosis*-specific antibodies is likely infected with *M. paratuberculosis*. Alternatively, an animal that is positive for anti-*M. paratuberculosis*-specific antibodies may have resisted infection following a previous exposure to *M. paratuberculosis*, or may possess maternally-transmitted anti-*M. paratuberculosis*-specific antibodies. Techniques for detecting anti-*M. paratuberculosis*-specific antibodies in a biological sample include ELISAs, Western blots, immunoprecipitations, and immunofluorescence. A *M. paratuberculosis*-specific polypeptide can be attached to a solid support such as a microtiter plate by known methods (Leahy et al., *supra*). In the presence of *M. paratuberculosis*, a polypeptide-antibody complex is formed.

Detection of an amplification product, a hybridization complex, an antibody-polypeptide complex, or a polypeptide-antibody complex is usually accomplished by

detectably labeling the respective agent. The term "labeled" with regard to an agent (*e.g.*, an oligonucleotide, a polypeptide, or an antibody) is intended to encompass direct labeling of the agent by coupling (*i.e.*, physically linking) a detectable substance to the agent, as well as indirect labeling of the agent by reactivity with another reagent that is directly labeled with a detectable substance. Detectable substances include various enzymes, prosthetic groups, fluorescent materials, luminescent materials, bioluminescent materials, and radioactive materials. Examples of suitable enzymes include horseradish peroxidase, alkaline phosphatase, β -galactosidase, or acetylcholinesterase; examples of suitable prosthetic group complexes include streptavidin/biotin and avidin/biotin; examples of suitable fluorescent materials include umbelliferone, fluorescein, fluorescein isothiocyanate, rhodamine, dichlorotriazinylamine fluorescein, dansyl chloride or phycoerythrin; an example of a luminescent material includes luminol; examples of bioluminescent materials include luciferase, luciferin, and aequorin, and examples of suitable radioactive material include ^{125}I , ^{131}I , ^{35}S or ^3H . Examples of indirect labeling include using a fluorescently labeled secondary antibody to detect an appropriate agent (*e.g.*, a primary antibody), or end-labeling an agent with biotin such that it can be detected with fluorescently labeled streptavidin.

In another embodiment, the methods further involve obtaining a biological sample from an animal known to be infected with *M. paratuberculosis* (positive control) and a non-infected (negative control) animal, contacting the control samples with an agent capable of detecting *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies, such that the presence or absence of *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies in the samples is determined. The presence or absence of *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies in the control samples should correlate with the presence and absence of *M. paratuberculosis* in the positive and negative control samples, respectively.

Methods of preventing a M. paratuberculosis infection

In one aspect, the invention provides methods for preventing a disease or condition associated with infection by *M. paratuberculosis* (*e.g.*, Johne's disease) in an animal by administering a compound to the animal that immunizes the animal against *M.*

paratuberculosis infection. Animals at risk for *M. paratuberculosis* infection can be administered the compound prior to the manifestation of symptoms that are characteristic of a *M. paratuberculosis* infection, such that a *M. paratuberculosis* infection is prevented or delayed in its progression.

5 In one embodiment, a compound that immunizes an animal can be a *M. paratuberculosis*-specific polypeptide. The sequences of representative *M. paratuberculosis*-specific polypeptides are disclosed herein (e.g., SEQ ID NOs:24-45) and can be produced using methods described herein. An *M. paratuberculosis*-specific polypeptide can be a fusion polypeptide, for example a *M. paratuberculosis*-specific
10 polypeptide-immunoglobulin fusion polypeptide in which all or part of a *M. paratuberculosis*-specific polypeptide is fused to sequences derived from a member of the immunoglobulin family. An *M. paratuberculosis*-specific polypeptide or fusion polypeptide of the invention can be used as an immunogen to elicit anti-*M. paratuberculosis*-specific antibodies in an animal, thereby immunizing the animal.

15 In another embodiment, a compound that immunizes an animal can be a *M. paratuberculosis*-specific nucleic acid molecule. A *M. paratuberculosis*-specific nucleic acid molecule used to immunize an animal can include one of the *M. paratuberculosis*-specific nucleic acid molecules having the sequence shown in SEQ ID NOs:1-23, 110-1341, or 1342. *M. paratuberculosis*-specific nucleic acid coding sequences (e.g., full-
20 length or otherwise) can be introduced into an appropriate expression vector such that a *M. paratuberculosis*-specific polypeptide or fusion polypeptide is produced in the animal upon appropriate expression of the expression vector. Expression of the *M. paratuberculosis*-specific nucleic acid molecule and production of a *M. paratuberculosis*-specific polypeptide in an animal thereby elicits an immune response in the animal and
25 thereby immunizes the animal.

 Compounds that can be used in immunogenic compositions of the invention (e.g., *M. paratuberculosis*-specific nucleic acid molecules or *M. paratuberculosis*-specific polypeptides) can be incorporated into pharmaceutical compositions suitable for administration. Such compositions typically comprise the nucleic acid molecule or
30 polypeptide, and a pharmaceutically acceptable carrier. As used herein, "pharmaceutically acceptable carrier" is intended to include any and all solvents,

dispersion media, coatings, antibacterial and anti-fungal agents, isotonic and absorption delaying agents, and the like, compatible with pharmaceutical administration. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active
5 compound, use thereof in the compositions is contemplated. Supplementary active compounds can also be incorporated into the compositions.

A pharmaceutical composition of the invention is formulated to be compatible with its intended route of administration. Examples of routes of administration include parenteral, *e.g.*, intravenous, intradermal, subcutaneous, oral (*e.g.*, ingestion or
10 inhalation), transdermal (topical), transmucosal, and rectal administration. Solutions or suspensions used for parenteral, intradermal, or subcutaneous application can include the following components: a sterile diluent such as water for injection, saline solution (*e.g.*, phosphate buffered saline (PBS)), fixed oils, a polyol (for example, glycerol, propylene glycol, and liquid polyethylene glycol, and the like), glycerine, or other synthetic
15 solvents; antibacterial and antifungal agents such as parabens, chlorobutanol, phenol, ascorbic acid, thimerosal, and the like; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid; buffers such as acetates, citrates or phosphates and agents for the adjustment of tonicity such as sodium chloride or dextrose. The proper fluidity can be maintained, for example, by the use of a
20 coating such as lecithin, by the maintenance of the required particle size in the case of dispersion and by the use of surfactants. In many cases, it will be preferable to include isotonic agents, for example, sugars, polyalcohols such as mannitol or sorbitol, and sodium chloride in the composition. Prolonged administration of the injectable compositions can be brought about by including an agent that delays absorption. Such
25 agents include, for example, aluminum monostearate and gelatin. The parenteral preparation can be enclosed in ampoules, disposable syringes or multiple dose vials made of glass or plastic.

Oral compositions generally include an inert diluent or an edible carrier. Oral compositions can be liquid, or can be enclosed in gelatin capsules or compressed into
30 tablets. Pharmaceutically compatible binding agents, and/or adjuvant materials can be included as part of an oral composition. Tablets, pills, capsules, troches and the like can

contain any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose; a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate or Sterotes; a glidant such as colloidal silicon dioxide; a
5 sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring. Transmucosal administration can be accomplished through the use of nasal sprays or suppositories. For transdermal administration, the active compounds are formulated into ointments, salves, gels, or creams as generally known in the art.

10 It is especially advantageous to formulate oral or parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suited as unitary dosages for an animal to be treated; each unit containing a predetermined quantity of active compound calculated to produce the desired therapeutic effect in association with the required pharmaceutical
15 carrier. The dosage unit forms of the invention are dependent upon the amount of a compound necessary to immunize the animal. The amount of a compound necessary to immunize an animal can be formulated in a single dose, or can be formulated in multiple dosage units. Immunization of an animal may require a one-time dose, or may require repeated doses.

20 For polypeptide vaccines, the dose typically is from about 0.1 mg/kg to about 100 mg/kg of body weight (generally, about 0.5 mg/kg to about 5 mg/kg). Modifications such as lipidation (*Cruikshank et al., 1997, J. Acquired Immune Deficiency Syndromes and Human Retrovirology*, 14:193) can be used to stabilize polypeptides and to enhance uptake and tissue penetration. For nucleic acid vaccines, the dose administered will
25 depend on the level of expression of the expression vector. Preferably, the amount of vector that produces an amount of a *M. paratuberculosis*-specific polypeptide from about 0.1 mg/kg to about 100 mg/kg of body weight is administered to an animal.

Articles of manufacture

30 The invention encompasses articles of manufacture (e.g., kits) for detecting the presence of *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M.*

paratuberculosis-specific antibodies in a biological sample (a test sample). Such kits can be used to determine if an animal has been exposed to, or is infected with, *M.*

paratuberculosis. For example, a kit of the invention can include an agent capable of detecting *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M.*

- 5 *paratuberculosis*-specific antibodies in a biological sample (e.g., a *M. paratuberculosis*-specific oligonucleotide, an anti-*M. paratuberculosis*-specific antibody, or a *M. paratuberculosis*-specific polypeptide, respectively).

- For antibody-based kits to detect *M. paratuberculosis*-specific polypeptides, the kit can include, for example, a first antibody (e.g., attached to a solid support) that has
10 specific binding affinity for a *M. paratuberculosis*-specific polypeptide and, optionally, a second antibody which binds to *M. paratuberculosis*-specific polypeptides or to the first antibody and is detectably labeled. For oligonucleotide-based kits to detect *M. paratuberculosis*-specific nucleic acids, the kit may comprise, for example, one or more oligonucleotides. For example, a kit of the invention can include a detectably labeled
15 oligonucleotide probe that hybridizes to a *M. paratuberculosis*-specific nucleic acid molecule or a pair of oligonucleotide primers for amplifying a *M. paratuberculosis*-specific nucleic acid molecule. Such oligonucleotides provided in a kit of the invention can be detectably labeled or, alternatively, the components necessary for detectably labeling an oligonucleotide can be provided in the kit. Polypeptide-based kits for
20 detecting anti-*M. paratuberculosis*-specific antibodies in a biological sample can contain a *M. paratuberculosis*-specific polypeptide as disclosed herein (e.g., attached to a solid support) and, optionally, an antibody which binds to *M. paratuberculosis*-specific polypeptides or to an anti-*M. paratuberculosis*-specific antibody and is detectably labeled.

- 25 Kits can include additional reagents (e.g., buffers, co-factors, or enzymes) as well as reagents for detecting the agent (e.g., labels or other detection molecules), as well as instructions for using such agents and reagents to detect the presence or absence of *M. paratuberculosis*-specific nucleic acids or polypeptides, or anti-*M. paratuberculosis*-specific antibodies. The kit can also contain a control sample or a series of control
30 samples that can be assayed and compared to the biological sample. Each component of

the kit is usually enclosed within an individual container and all of the various containers are within a single package.

The invention also encompasses articles of manufacture (e.g., vaccines) for preventing *M. paratuberculosis* infection in an animal. Articles of manufacture of the invention can include pharmaceutical compositions containing either a *M. paratuberculosis*-specific nucleic acid molecule or a *M. paratuberculosis*-specific polypeptide. Such nucleic acid molecules or polypeptides are formulated for administration as described herein, and are packaged appropriately for the intended route of administration. Pharmaceutical compositions of the invention further can include instructions for administration.

The invention will be further described in the following examples, which do not limit the scope of the invention described in the claims.

EXAMPLES

Example 1 - Mycobacterial strains

Mycobacteria used in this study are listed in Table 3. All mycobacteria were cultured in Middlebrook 7H9 media with 0.05% Tween 80 and oleic acid albumin dextrose complex (Becton Dickinson Microbiology, Sparks, MD). Cultures containing *M. paratuberculosis* isolates were supplemented with 2 mg/L ferric mycobactin J (Allied Monitor Inc., Fayette, MO). All growth flasks were incubated at 37°C without shaking.

5 Example 2 - Annotation of *M. paratuberculosis* contigs greater than 10 kb

The sequencing and assembly strategies used herein for *M. paratuberculosis* were as described for *Pasteurella multocida* (see May et al., 2001, *Proc. Natl. Acad. Sci. USA*, 98:3460-5). For these studies, assembled *M. paratuberculosis* contig fragments greater than 10 kb were chosen. Predicted coding sequences were identified using ARTEMIS software and TB-parse, a program used to identify coding sequences in the *M. tuberculosis* genome (Cole et al., 1998, *Nature*, 393:537-44). The results were compared and verified manually in ARTEMIS. A putative ribosome-binding site (RBS) was also evaluated for each coding sequence. The presence of an AG-rich sequence approximately 30-bp upstream of the start codon was scored as a putative RBS sequence. Similarities were identified with BLASTP analysis by using GenBank and a local database.

constructed by the Computational Biology Center at the University of Minnesota (<http://www.cbc.umn.edu>).

ARTEMIS and ACT are funded by the Wellcome Trust's Beowulf Genomics initiative and are available free on the internet at <http://www.sanger.ac.uk/Software/>.

5 Sequence alignments between *M. paratuberculosis* and *M. avium* were compared and visualized with ACT software. *M. avium* is being sequenced by The Institute for Genomic Research (TIGR; http://www.tigr.org/cgi-bin/BlastSearch/blast.cgi?organism=m_avium). Sequence alignments to produce figures or schematic illustrations were performed with AssemblyLIGN™ software (Accelrys, 10 Princeton, NJ).

The nucleotide sequence of each *M. paratuberculosis* gene described in this study was deposited individually in the GenBank/EMBL Nucleotide Sequence Data Library and were assigned GenBank Accession Nos. AF445420 through AF445446.

15 Example 3 - DNA hybridizations

Genomic DNA was extracted from several species of mycobacteria using a modified method from that described by Whipple et al. (Whipple et al., 1987, *J. Clin. Microbial.*, 25:1511-15). Briefly, one liter of Middlebrook 7H9 cultured mycobacteria was incubated at 37°C until an OD₅₄₀ of between 0.50 and 0.56 was reached. D- 20 Cycloserine was added to the media at a final concentration of 0.5 mg/ml and incubated an additional 24 h. Mycobacteria were harvested by centrifugation at 8,000 rpm for 15 min and the pellet was resuspended in 11 ml of Qiagen buffer B1 containing 1 mg/ml Qiagen RNase A. Lipase was added (450,000 Units, Sigma Catalog No L4384) to digest mycobacterial cell wall lipids. Following incubation for 2 h at 37°C, 20 mg of lysozyme 25 was added and incubation proceeded for an additional 3 h at 37°C. 500 µl of Qiagen proteinase K (20 mg/ml) was added and incubated for 1.5 h at 37°C. Qiagen buffer B2 (4 ml) was added and the slurry mixed and incubated 16 h at 50°C. The remaining cellular debris was removed by centrifugation at 10,000 rpm for 20 min. The supernatant was poured over a pre-equilibrated Qiagen 500/G genomic tip. The loaded column was 30 washed and processed according to the instructions of the manufacturer. *Pst*I restricted DNA fragments were separated on a 1% agarose gel. DNA-containing gels were

depurinated, denatured, and neutralized as described by Sambrook et al. (1989, *Molecular Cloning: A Laboratory Manual*, Second Ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, New York). DNA was transferred by capillary action to BrightStar-Plus membranes (Ambion, Austin, TX) and probes were labeled using [α - 32 P]dCTP (ICN, Cost Mesa, CA) by random priming. Hybridization was performed in a AUTOBLOT hybridization oven (Bellco Biotechnology, Vineland, NJ) at 45°C for 16 h in ExpressHyb hybridization solution (Clontech, Palo Alto, CA). Probed blots were washed sequentially with solutions increasing in stringency as follows: 2 washes at room temp in 2X SSC, 0.1% SDS; 2 washes at room temp in 0.2X SSC, 0.1% SDS; and 2 washes at room temp in 0.16X SSC, 0.1% SDS. Detection was by autoradiography at room temp using BioMax MR film (Kodak, Rochester, NY) with a Kodak intensifying screen for less than 16 hours.

Example 4 - PCR amplification

Oligonucleotide primers listed in Table 4 were designed using the *M. paratuberculosis*-specific nucleic acid sequences identified herein. PCR amplification of *M. paratuberculosis*-specific nucleic acid molecules was performed as follows. A PCR master mix was generated that contained (each in final concentration) 1x AmpliTaq Gold buffer (Perkin-Elmer), 5% dimethylsulfoxide (DMSO, Sigma), 20 mM each nucleotide (Roche Biochemicals), 10 ng genomic DNA, and 1 Unit of AmpliTaq Gold DNA polymerase (Perkin-Elmer). Primers were added to individual PCR tubes containing 25 μ l of master mix. The PCR reaction conditions were as follows: a 5 min denaturing step at 94°C, followed by 35 cycles of: 94°C for 45 sec, 55°C for 1 min, and 72°C for 2 min. At the end of 35 cycles, there was a 7 min incubation at 72°C and a hold at 4°C. High fidelity *Pwo* polymerase (Boehringer Ingelheim Pharmaceutical Inc., Ridgefield, CT) was used in amplifications to generate probes used in Southern hybridization experiments. All other amplifications used Taq DNA polymerase (Roche Molecular Biochemicals, Indianapolis, IN).

Primers are shown in the 5' to 3' direction

- 5 Primers used to amplify the #7 sequence for a probe in Southern hybridizations were 5'-ATC AGG CTG ACG GGA TTG CCC-3' (SEQ ID NO:88) and 5'-TCA ACG AGT GCA CGG GAA CC-3' (SEQ ID NO:89).

10 Example 5 - Twenty-seven *M. paratuberculosis* predicted coding sequences are not present in *M. avium*

- 15 The complete genome of *M. paratuberculosis* K-10, a field isolate recovered from a cow with clinical Johne's disease, is currently being sequenced (<http://www.cbc.umn.edu/ResearchProjects/AGAC/Mptb/Mptbhome.html>). The genome size is estimated to be >5 Mb based on assembled sequence data, and by July, 2001, 2.65 Mb were contained in contig fragments greater than 10 kb. Those Contigs above 10 kb

were annotated using ARTEMIS and represent 48% of the total genome. The average size of the annotated contigs is 25 kb with one contig over 70 kb. Each gene within the annotated contig set was also checked manually and confirmed by TB-parse. These contigs were aligned with *M. avium* sequence data generated at TIGR. TIGR has 612
5 contigs that total 5,867,714 bp in the July 8, 2001 data set.

M. avium and *M. paratuberculosis* display a high degree of similarity at the nucleotide level as well as local gene order conservation. An analysis of an 11-kb region surrounding the origin of replication for each of these genomes shows 98% sequence identity at the nucleotide level. The sequence similarity between orthologs in *M.*
10 *paratuberculosis* and *M. avium* was greater than between *M. paratuberculosis* and other mycobacterial species. A more global comparison shows that these strong nucleotide identities are present throughout both genomes. Despite this strong genetic similarity, a total of 27 genes from the annotated *M. paratuberculosis* contigs were identified that did not align with the unfinished *M. avium* genome by computerized alignments. Of these,
15 three contained weak similarity to proteins in other mycobacterial species or proteins in GenBank. This left 24 genes that have no significant similarity to any known proteins. Since only about half of the *M. paratuberculosis* genome was used in these analyses, a complete genome analysis may reveal an estimated 50 unique *M. paratuberculosis* genes.

Some *M. paratuberculosis* sequences that did not align with *M. avium* sequences,
20 either *in silico* or experimentally, contain similarity to other mycobacterial species. One such sequence, designated #7, was tested by PCR and Southern hybridization with two *M. avium* isolates and two *M. paratuberculosis* strains. An amplified PCR fragment was produced only with *M. paratuberculosis* genomic DNA as template. Likewise, DNA hybridization on Southern blots detected only *M. paratuberculosis* sequences, not *M.*
25 *avium*. However, BLASTP analysis of the #7 sequence revealed strong similarity to hypothetical proteins in the *M. tuberculosis* genome.

Example 6 - PCR analysis

PCR amplification was performed on several mycobacterial species, strains and
30 isolates to experimentally determine the specificity for 26 of the 27 sequences (Table 5). Gene 128 was not included in these analyses because it had the lowest expect value

(highest similarity to a sequence in GenBank) of the 27 sequences by BLASTP analysis. These data show that primers designed from all 26 *M. paratuberculosis*-specific genes from isolate K-10 could produce an amplified product in all 10 *M. paratuberculosis* strains or isolates tested. In addition, despite an absence of any homologous sequences in public databases, PCR products of the correct size were obtained for five genes using template from other mycobacterial species. Following this analysis a core group of 21 genes remained that are present only in *M. paratuberculosis* (Table 5).

Example 7 - Sequence analysis of an *M. paratuberculosis*-specific eight gene cluster

Eight genes were present on contig fragment 1614. These eight genes are arranged in tandem, span a total of 4.4 kb at the end of the 1614 contig (Figure 1), and are present only in *M. paratuberculosis* (Table 5). 1408-bp upstream of gene 250 is an integrase gene that contains similarity to other mycobacteriophage integrases. This 4.4-kb segment (designated #481 (SEQ ID NO:23)) contains genes 250-257 and is located at the end of the 46-kb contig 1614. The sequences represented by #481 were found to align with the 94-kb contig 1398 present in a different contig assembly data set (Figure 1). The #481 sequence aligned near the center of the 94-kb contig, essentially at position 35 to 45 kb. A trimmed portion of the 1398 contig is shown in the alignment in Figure 1. The results of this analysis further extended the region of *M. paratuberculosis*-specific nucleic acid sequence to a 9.4-kb region, which does not align with *M. avium* sequence *in silico*.

30	“+” indicates that an amplification product of the correct size was detected by ethidium bromide staining. “-” indicates that no amplification product was detected by ethidium bromide staining.											

"4" indicates that an amplification product of the correct size was detected by ethidium bromide staining.

"-" indicates that no amplification product was detected by ethidium bromide staining.

A TBLASTX analysis was performed on the 9.4-kb sequence (designated contig 1398-trimmed in Figure 1). The results of these analyses revealed that, while no sequences aligned with *M. avium*, the ends of contig 1398-trimmed align with sequences in *M. tuberculosis*. This leaves a core sequence of eight ORFs within the #481 sequence that are present only in *M. paratuberculosis*. This core sequence is flanked by 1408 bp of non-coding sequence downstream and 1092-bp of non-coding sequence upstream (Figure 1). Therefore, this novel core sequence is well separated from other predicted open reading frames.

10 Example 8 - Southern hybridization analysis shows that the #481 sequence is specific to *M. paratuberculosis*

To confirm experimentally that #481 is present only in *M. paratuberculosis*, three arbitrarily chosen genes of the #481 sequence (251, 253, and 255) were radiolabeled and used as probes in DNA hybridization with several mycobacterial species including *M. fortuitum*, *M. bovis*, *M. intracellulare*, *M. avium*, and *M. paratuberculosis*. Following Southern blotting, only a *M. paratuberculosis* fragment greater than 9.5 kb was detected by each of the three probes.

20 Example 9 - Characteristics of *M. paratuberculosis*-specific polypeptides

The characteristics of *M. paratuberculosis*-specific polypeptides shown in Table 6 were obtained using MacVector sequence analysis software (Oxford Molecular).

Table 6
Characteristics of *M. paratuberculosis*-specific polypeptides

257	5.48	9,358

Example 10 - Expression of *M. paratuberculosis* genes in *E. coli*

To confirm coding predictions of novel *M. paratuberculosis* genes and assess their immunogenicity, coding sequences were amplified from the genome by PCR and cloned into the pMAL-c2 *E. coli* expression plasmid. These proteins were expressed as a fusion with *E. coli* maltose binding protein (MBP) to enable affinity purification on an amylose resin column. An immunoblot was probed with a monoclonal antibody that binds MBP, which identified each fusion protein. A duplicate immunoblot was probed with polyclonal sera from a rabbit immunized with a heat-killed preparation of *M. paratuberculosis*. Only the fusion protein containing the *M. paratuberculosis* specific polypeptide produced from gene 253 was detected by the rabbit sera, indicating that the polypeptide encoded by gene 253 was produced by *M. paratuberculosis*. The MBP protein was not detected by the polyclonal sera.

Example 11 - The psp-1 gene product is recognized by sera from cattle with Johne's disease

The polypeptide produced from gene 253 was termed psp-1 (paratuberculosis-specific protein). To determine if psp-1 is recognized during infection of cattle, the purified MBP/psp-1 fusion was evaluated further by immunoblot with sera from cattle with overt signs of Johne's disease. Sera from all three Johne's cows examined recognized the MBP/psp-1 fusion protein but did not recognize MBP alone. Another *M.*

paratuberculosis-MBP fusion protein using gene 251 was also evaluated in this experiment, but the fusion protein produced therefrom was only weakly detected.

Immunoblot analysis of psp-1 was further expanded to include additional sera from John's cattles as well as control cattle housed at NADC and a local Iowa dairy herd. The polypeptide designated psp-1 was not detected by sera from 7 control cows, but was detected by 14 of 16 John's cows tested.

Example 12 - Expression of *M. paratuberculosis* coding sequences

Coding sequences within *M. paratuberculosis*-specific DNA fragments are cloned into *E. coli* expression vectors (*e.g.*, containing a sequence encoding a 6x His tag). Heterologously expressed mycobacterial proteins are affinity purified from *E. coli* lysates by a polyhistidine tag. These purified proteins are then evaluated serologically with a panel of sera from infected and control cows to determine if the protein is recognized by sera from infected animals.

Specifically, each open reading frame identified as unique to *M. paratuberculosis* is amplified from genomic DNA, cloned into the pCRT7 expression vector (Invitrogen), and transformed into *E. coli* DH5- α . Each of the constructs are verified by DNA sequence analysis. The level of expression of the gene of interest is evaluated by loading the recombinant *E. coli* lysates onto SDS-PAGE gels and staining them in Coomassie blue. Expressed proteins are purified from *E. coli* lysates using the vector-encoded polyhistidine tag that has affinity for metal ions. Column purification using TALON metal resin (Clontech) is used. The fusion alone is used as a negative control. Comparisons of the reactivity of a collection of cattle antisera with the fusion proteins are conducted using a slot-blotting device (BioRad). Lysates of recombinant *E. coli* are loaded onto preparative 12% (w/v) polyacrylamide gels and transferred to nitrocellulose. After blocking, these filters are placed into the slot-blot device. Individual cattle antisera, each diluted 1:200, is added to independent slots. The rest of the procedure is carried out using standard immunoblot protocols. Protein G-peroxidase diluted 1:25,000 or anti-bovine IgG-peroxidase diluted 1:20,000 are used for detection of bound antibody.

Example 13 - Production of monoclonal and polyclonal antibodies against *M. paratuberculosis*-specific polypeptides

All expressed and purified *M. paratuberculosis*-specific polypeptides are used to immunize both BALB/c mice and New Zealand white rabbits. Standard immunization regimens are used in each instance. TiterMax or Freund's incomplete serve as the adjuvant. Splenic lymphocytes from the immunized mice are hybridized with myeloma cells for the production of monoclonal antibodies. ELISA is the method used to assay secreting hybridomas for reactivity to purified antigens. Hybridomas in positive wells are cloned and expanded using standard methods. Rabbit antisera is collected following boost injections of isolated polypeptide until a sufficient titer is obtained.

Example 14 - ELISA assays

Improvement in the specificity of the ELISA test for detection of animals with Johne's disease has always been a major goal. The only test commercially available in the US is a direct test that uses a protoplasmic antigen preparation (Dubash et al., 1995, *J. Vet. Diag. Invest.*, 7:347-51; Collins & Sockett, 1993, *J. Am. Vet. Med. Assoc.*, 203:1456-63). Efforts to amplify antigen/antibody reactions focus on the use of an indirect biotin/avidin system. The purified *M. paratuberculosis*-specific polypeptide to be evaluated is diluted in PBS and added to 96-well microtiter plates. Plates with bound polypeptide are blocked in PBS containing 1% gelatin and then washed three times with PBS containing 0.05% Tween. Test cattle sera is diluted 1:400 in PBS, added to individual wells, and processed as a standard ELISA. Mouse anti-bovine IgM or mouse anti-bovine IgG is the second antibody in these assays. Results show that the use of a biotinylated second antibody followed by streptavidin/alkaline phosphatase and enzyme detection enhances test sensitivity 8 to 16-fold (based on antibody titers) as compared to the standard direct ELISA.

The method described herein using a *M. paratuberculosis*-specific polypeptide is compared to the commercially available direct ELISA by determining antibody titers of sera from clinically affected animals. Sera selected for these evaluations will include samples from both clinical and subclinical animals at NADC and from a nearby dairy herd (State Center, IA) shown to have Johne's disease. For all evaluations, it is necessary

to include samples from known negative animals to assess specificity. In addition, because of potential cross-reactivity that may be encountered with other bacteria, especially other mycobacteria, sera from animals known to be naturally or experimentally infected with other mycobacterial, particularly *M. avium*, are included. These controls
5 determine whether the ELISA test detects only *M. paratuberculosis*-infected cattle.

Example 15 - Use of antibodies against *M. paratuberculosis*-specific polypeptides in immunohistochemical diagnosis of infected bovine tissues

Histopathologic analysis of tissues from infected animals is a rapid method of
10 detecting *M. paratuberculosis*. Biopsy tissue or tissue samples taken at necropsy are stained for acid-fastness to determine the presence of *M. paratuberculosis*. However, this method is non-specific and does not distinguish among mycobacterial species. Therefore, bovine tissues from *M. paratuberculosis*-, *M. bovis*-, *M. avium*-infected and uninfected animals are tested by histopathologic analysis using high-titer antibodies directed at *M.*
15 *paratuberculosis*-specific polypeptides. Briefly, samples from the ileum and mesenteric lymph node of cows are fixed in buffered formalin, processed routinely, and embedded in paraffin wax. 6 µm cut sections are stained with hematoxylin and eosin or Ziehl-Neelsen by conventional methods. Replicate unstained sections will be prepared for immunohistochemistry. Sections that are immunostained are deparaffinized, rehydrated
20 and blocked using routine methods (Stabel et al., 1996, *J. Vet. Diagn. Invest.*, 8:469-73). Blocked sections are incubated with *M. paratuberculosis*-specific antibodies developed in the above-described studies. Depending on the nature of the primary antibody, either goat anti-rabbit biotinylated antibody or goat anti-mouse biotinylated antibody is added followed by washing instreptavidin-alkaline phosphatase solution. The tissue is stained
25 with chromogen, and Histomark Red. Results are visualized under a bright-field microscope. Staining intensities are quantitatively compared among the different infected and uninfected tissues.

Example 16 - Detection of *M. paratuberculosis* by PCR amplification

30 Detection of *M. paratuberculosis* using oligonucleotide primers complementary to *M. paratuberculosis*-specific genes 93, 135, 218, 228, 240, and 251 or oligonucleotide

primers complementary to IS900 nucleic acid sequences was examined by PCR. IS900 primer sequences were as follows: 5'-AAT CAA CTC CAG CAG CGC GGC CTC G-3' (SEQ ID NO:108) and 5'-CCG CTA ATT GAG AGA TGC GAT TGG-3' (SEQ ID NO:109). Fourteen fecal samples were processed from cattle in various stages of shedding. The bacterial load being shed by each animal was determined by culture on 7H10 slants.

To detect *M. paratuberculosis* by amplification of nucleic acids from a biological sample, a PCR master mix was generated similar to that described in Example 4 with the addition to the master mix of 10 mM MgCl. The PCR reaction conditions for amplification of nucleic acids from a biological sample were as follows: a 10 min denaturing step at 94°C, followed by 50 cycles of: 94°C for 59 sec, 60°C for 30 sec, and 72°C for 1 min. At the end of 50 cycles, there was a 10 min incubation at 72°C followed by a hold at 4°C.

Results of the PCR assays are as follows. Seven cattle identified as shedding heavily were all positive for *M. paratuberculosis* nucleic acid using either IS900 or MP228 primers. Out of 5 cattle identified as medium shedders, primers directed toward IS900 detected *M. paratuberculosis* nucleic acid in 1 animal, while primers directed toward MP228 detected *M. paratuberculosis*-specific nucleic acid in 2 animals. Out of 2 cattle identified as low shedders, primers directed toward IS900 detected *M. paratuberculosis* nucleic acid in 1 animal, while MP228 primers didn't detect *M. paratuberculosis*-specific nucleic acid in any animal. In titrations of *M. paratuberculosis* genomic DNA (isolate K-10), IS900 nucleic acids were detectable in 1 fg of nucleic acid, while each of the *M. paratuberculosis*-specific nucleic acids were detectable in 10 fg of nucleic acid.

Table 7
Primers used in PCR amplifications

Primer Name	Primer sequence	SEQ ID NO:	Gene

Example 17—Analysis of the *M. paratuberculosis* genome

A shotgun strategy was adopted to sequence the genome of *M. paratuberculosis* strain K-10. To create a small (1.5- to 3.0-kb) insert library, genomic DNA was isolated using a chloroform/cetyltrimethylammonium bromide-based method and DNA was sheared by nebulization and cloned into a pUC18 plasmid vector for shotgun sequence analyses essentially as described (May et al., 2001, *Proc. Natl. Acad. Sci., USA*, 98:3460-5). Approximately 24,000 clones were sequenced from both ends using Dye-terminator chemistry on ABI 3700 and 3100 (Applied Biosystems) sequencing machines and a total of 45,653 sequences (representing ~ 7.8-fold coverage of the genome) were generated in this manner for inclusion in the final sequence assembly. Sequence assembly and verification were accomplished by using the phredPhrap and Consed suite of software (<http://genome.washington.edu>). In order to close the final ~400 gaps at the end of the shotgun phase, several methods were used, including primer walking and random PCR. The final sequence showed that the *M. paratuberculosis* genome was a single circular chromosome of 4,830,869 bp and an average GC content of 69.3%.

The sequence of the entire *M. paratuberculosis* genome (SEQ ID NO:1355) is shown in Table 8 (contained on the appended compact disc, which has been incorporated by reference herein).

The resulting approximately 24,000 nucleic acid segments were analyzed as follows. Each of the 24,155 segments was compared to the *M. avium* genome using BLASTN (released May 14, 2002). 23,056 segments had homology to *M. avium* sequences, while 1,099 segments had no homology with sequences in the *M. avium* database. Of the 23,056 segments having homology to *M. avium* sequences, 22,558 segments had >50% sequence identity to *M. avium* sequences, while 498 segments possessed <50% sequence identity to *M. avium* sequences. The 498 segments having <50% sequence identity to *M. avium* sequences were then compared to sequences in the GenBank database (having a release date of December 28, 2002) using BLASTN. Of the 498 segments used in the BLASTN comparison, 130 segments were identified as having <50% sequence identity with sequences in the GenBank database, while 277 segments had no sequence identity with sequences in the GenBank database. Those 407 segments (277 segments + 130 segments) were considered to be *M. paratuberculosis*-specific nucleic acids. The 1,099 segments that had no homology to *M. avium* sequences were then compared to the GenBank database using the BLASTN. 702 segments had no homology with sequences in GenBank, while 397 segments possessed homology with sequences in the GenBank database. Of those 397 segments, 29 segments exhibited <50% sequence identity with sequences in the GenBank database, while 95 segments exhibited sequence identity with *M. paratuberculosis* sequences that were previously submitted to the GenBank database. Those 825 segments (702 segments + 29 segments + 95 segments) were also considered to be *M. paratuberculosis*-specific nucleic acids.

The positions of these *M. paratuberculosis*-specific nucleic acids are schematically shown in Figure 5. The sequences of the resulting 1,232 *M. paratuberculosis*-specific nucleic acids are shown in Figure 6 (SEQ ID NOs:110-1342). As can be seen from the numerical designations of the 1,232 segments (Figure 6), many of the 200 nucleotide segments are contiguous. Therefore, any number of contiguous segments can be joined to generate a longer *M. paratuberculosis*-specific nucleic acid.

Potential coding sequences (CDSs) in the genome were predicted by using GLIMMER, and ARTEMIS, and the results were compared and verified manually in ARTEMIS. Homology studies using the predicted polypeptide sequence were completed with BLASTP analysis by using customized sequence databases constructed by the
5 Computational Biology Center at the University of Minnesota (<http://www.cbc.umn.edu>). Table 9 (contained on the appended compact disc, which has been incorporated by reference herein) describes the annotation of the *M. paratuberculosis* genomic sequences, and Table 10 (contained on the appended compact disc, which has been incorporated by reference herein) describes the predicted amino acid sequences encoded by each
10 identified coding sequence.

Example 18 - DNA isolation from bacterial culture and fecal samples

A total of 161 bacterial isolates were used in these studies, including *M. paratuberculosis* (n = 118), *M. avium* (n = 21), and other mycobacterial and non-
15 mycobacterial species (n = 22). See Table 11. *M. paratuberculosis* strain K-10 was used as the standard strain. *M. paratuberculosis* isolates were grown on Middlebrook 7H9 broth or 7H11 agar (Difco Laboratories, Detroit, MI) with OADC supplement (Becton Dickinson, Sparks, MD) and mycobactin J (2 mg/100 ml), and cultures were incubated at 37°C for 4-6 months until colonies were observed. *M. avium* isolates were grown on
20 Middlebrook 7H9 broth without mycobactin J and cultures were incubated at 37°C for 2 weeks. Other mycobacterial and non-mycobacterial species were grown on LB medium and incubated overnight at 37°C.

DNA was isolated from bacterial cultures using the QIAamp DNA Mini Kit (QIAGEN Inc., Valencia, CA). Briefly, bacteria were pelleted and resuspended in 180 µl
25 Buffer ALT. Proteinase K (20 µl) was added, and the samples were vortexed and incubated at 56°C for 10 minutes. After addition of 200 µl Buffer AL, the samples were incubated at 70°C for 10 minutes. Ethanol (200 µl) was added and the samples were vortexed and loaded onto spin columns, which were subjected to centrifugation at 8000 rpm for 1 minute. The columns were washed with 500 µl Buffer AW and the DNA was
30 eluted in 50 µl distilled water.

Table 11
Mycobacterium isolates tested

<i>S. aureus</i>		1
Total:		161

5 The QIAamp DNA Stool Mini Kit (QIAGEN Inc.) was used to isolate DNA from stool samples. Briefly, 1.4 ml Buffer ASL was added to 200 mg of sample (1 gm of sample can be used with 10X Buffer ASL). The mixtures were vortexed, heated at 95°C for 5 minutes, and pelleted to remove stool particles, and 1.2 ml of each resulting supernatant was transferred to a new 2 ml tube. An InhibitEX tablet was added to each

10 sample, and the tubes were vortexed and then incubated for 1 minute at 25°C. The mixtures were pelleted and 15 µl of Proteinase K was added to 200 µl of each supernatant. Buffer AL (200 µl) was added and the samples were incubated at 70°C for 10 minutes. After addition of 200 µl ethanol, samples were vortexed and loaded onto spin columns. The columns were subjected to centrifugation at 8000 rpm for 1 minute

15 and then washed two times with 500 µl Buffer AW1 and Buffer AW2. DNA was eluted in 50 µl distilled water.

Example 19 – Real-time PCR

A PCR master mix was prepared containing the following: 1X TaqMan Buffer A (Perkin Elmer), 5.0 mM MgCl₂, 1.25 units per reaction Amplitaq Gold, 200 μM dATP, 200 μM dCTP, 200 μM dGTP, 400 μM dUTP, 5% DMSO, 0.01 units per reaction UNG, 100 μM of each primer, and 150 μM of each probe. Five μl of template DNA was placed in each PCR reaction tube, and 45 μl of Master mix was added. PCR samples were subject to initial denaturation at 50°C for 10 minutes and then at 95°C for 10 minutes; 40 amplification cycles of 94°C for 30 seconds, 60°C for 30 seconds, and 72°C for 1 minute; a final extension at 72°C for 7 minutes; and a soak at 25°C. Specific PCR products were detected using the ABI Prism 7700 or 7900HT Sequence Detection System (Applied Biosystems, Inc.). Results were recorded as Delta-RQ, which is the difference in the Rn values from the samples and the no-template control. The Rn values are the ratio of reporter emission to quencher emission. Agarose gel electrophoresis with ethidium bromide staining was performed to verify the results of the TaqMan assay. All assays were performed in duplicate.

To evaluate the sensitivity of the assay, ten-fold dilutions of *M. paratuberculosis* strain K-10 cells were spiked into a negative fecal sample collected from a known *M. paratuberculosis*-free dairy farm. *M. paratuberculosis* DNA amounts ranged from 100 ng to 1 fg, equivalent to 112900 to 0.0011 molecules/reaction. DNA was extracted from the spiked samples using a QIAamp DNA Stool Mini Kit, the sensitivity of the assay for detecting *M. paratuberculosis* in fecal samples was assessed by PCR as described above.

The specificity of the assay was evaluated using template DNA from other mycobacteria (*n*=48), and non-mycobacterial spp. (*n*=3). In addition, the TaqMan assay was compared to conventional PCR, which was performed using primer sequences complimentary to SR134 (see Table 12).

Table 12

Example 20 – Use of real-time PCR for detection and quantitation of *M. paratuberculosis*

A real-time PCR assay was developed for detection and quantitation of *M. paratuberculosis*. Primers and probes were designed based on a novel unique sequence, SR134 (Table 11). SR134 is a sequence unique to *M. paratuberculosis* and is present in 6 copies in the genome. To increase sensitivity, two sets of primer-probe combinations were tested and used in the TaqMan assay as a multiplex strategy to amplify 211 bp and 215 bp fragments of the *M. paratuberculosis* SR134 sequence. Assay conditions were optimized for MgCl₂, primer, and probe concentrations in the reaction mix; optimal concentrations were found to be 5.0 mM MgCl₂, 100 nM each primer, and 150 nM each probe.

To quantitate standard *M. paratuberculosis*, curves resulting from amplification of SR134 from known amounts of *M. paratuberculosis* DNA (100 ng to 1 fg) were generated. A regression line was generated from the data points, and the correlation coefficient (R^2) value was determined to be 0.99. The ability to employ the TaqMan approach for quantitation of *M. paratuberculosis* also was determined. For example, a sample containing a “blinded” number of *M. paratuberculosis* cells had a Ct value of 24.16, which was equivalent to 0.082 ng DNA or 96 cell equivalents, and closely approximates the 100 cell equivalents that were spiked into the sample.

Known amounts of *M. paratuberculosis* K-10 genomic DNA were used to test the sensitivity of the assay. DNA concentrations ranging from 100 ng to 1 fg resulted in Ct values of 15.18 to 39.09. The cut-off point for accurate detection of *M. paratuberculosis* K-10 DNA was approximately 100 fg of DNA (35.04 Ct), which represents 0.11 cell
5 equivalents of *M. paratuberculosis*. Ten-fold dilutions of *M. paratuberculosis* K-10 cells spiked in feces also were used to determine the sensitivity of the assay. The assay was reliably able to detect 1 cell of *M. paratuberculosis* per PCR reaction.

The specificity of the TaqMan assay was tested using 118 *M. paratuberculosis* isolates from different animal species including bovine, ovine, murine, and humans,
10 isolates representing 7 other mycobacterial species (n=27) including the closely related *Mycobacterium avium*, atypical mycobacteria (n=4), and uncharacterized non-MAP (n=9) (Table 11). The SR134 TaqMan assay was able to detect all but two *M. paratuberculosis* isolates, whereas no amplification was observed with any of the other mycobacterial and non-mycobacterial species. Thus, this assay was 100% specific for amplification of *M.*
15 *paratuberculosis* DNA.

OTHER EMBODIMENTS

It is to be understood that while the invention has been described in conjunction
20 with the detailed description thereof, the foregoing description is intended to illustrate and not limit the scope of the invention, which is defined by the scope of the appended claims. Other aspects, advantages, and modifications are within the scope of the following claims.

WHAT IS CLAIMED IS:

1. An isolated nucleic acid, wherein said nucleic acid comprises a nucleic acid molecule of 10 nucleotides to 969 nucleotides, said molecule having at least 75%
5 sequence identity to SEQ ID NO:1 or to the complement of SEQ ID NO:1, wherein any said molecule that is 10 to 35 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of
10 *Homo sapiens*, *Pseudomonas aeruginosa*, *Streptomyces viridochromogenes*, *Mus musculus*, *Felis catus*, and *Xanthomonas campestris* using an appropriate third nucleic acid molecule.
2. The nucleic acid of claim 1, wherein said nucleic acid molecule has the
15 sequence shown in SEQ ID NO:1.
3. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least 75% sequence identity to SEQ ID NO:1.
- 20 4. The nucleic acid of claim 3, wherein the nucleic acid molecule has the sequence shown in SEQ ID NO:102.
5. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least 80% sequence identity to SEQ ID NO:1.
25
6. The nucleic acid of claim 5, wherein said nucleic acid molecule has the sequence shown in SEQ ID NO:103.
7. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least
30 85% sequence identity to SEQ ID NO:1.

8. The nucleic acid of claim 7, wherein said nucleic acid molecule has the sequence shown in SEQ ID NO:104.

9. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least
5 90% sequence identity to SEQ ID NO:1.

10. The nucleic acid of claim 9, wherein said nucleic acid molecule has the sequence shown in SEQ ID NO:105.

10 11. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least 95% sequence identity to SEQ ID NO:1.

12. The nucleic acid of claim 11, wherein said nucleic acid molecule has the sequence shown in SEQ ID NO:106.
15

13. The nucleic acid of claim 1, wherein said nucleic acid molecule has at least 99% sequence identity to SEQ ID NO:1.

14. The nucleic acid of claim 13, wherein said nucleic acid molecule has the
20 sequence shown in SEQ ID NO:107.

15. A vector comprising the nucleic acid of claim 1.

16. A host cell comprising the vector of claim 15.
25

17. An isolated polypeptide encoded by the nucleic acid of claim 1.

18. The isolated polypeptide of claim 17, wherein said polypeptide has the amino acid sequence shown in SEQ ID NO:24.
30

19. An article of manufacture, wherein said article of manufacture comprises the polypeptide of claim 17.

20. An antibody, wherein said antibody has specific binding affinity for the polypeptide of claim 17.

21. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:
contacting said biological sample with one or more of the nucleic acids of claim 1 under standard amplification conditions, wherein an amplification product is produced if *M. paratuberculosis* nucleic acid is present in said biological sample; and detecting the presence or absence of said amplification product, wherein the presence of said amplification product indicates the presence of *M. paratuberculosis* in the biological sample, and wherein the absence of said amplification product indicates the absence of *M. paratuberculosis* in the biological sample.

22. The method of claim 21, wherein said biological sample is derived from a cow, a sheep, a goat, a rabbit, a deer, an antelope, a bison, or a human.

20

23. The method of claim 21, wherein said biological sample is a fecal sample or a milk sample.

24. The method of claim 21, wherein said one or more nucleic acids comprise a nucleic acid sequence selected from the group consisting of SEQ ID NO:46 and SEQ ID NO:47.

25

25. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:

contacting said biological sample with one or more of the nucleic acids of claim 1 under hybridization conditions, wherein a hybridization complex is produced if *M. paratuberculosis* nucleic acid is present in said biological sample; and

detecting the presence or absence of said hybridization complex,

5 wherein the presence of said hybridization complex indicates the presence of *M. paratuberculosis* in said biological sample, and wherein the absence of said hybridization complex indicates the absence of *M. paratuberculosis* in said biological sample.

10 26. The method of claim 25, wherein nucleic acids present in said biological sample are electrophoretically separated.

27. The method of claim 26, wherein said electrophoretically separated nucleic acids are attached to a solid support.

15

28. The method of claim 27, wherein said solid support is a nylon membrane or a nitrocellulose membrane.

29. The method of claim 25, wherein said one or more nucleic acids are
20 labeled.

30. The method of claim 25, wherein said biological sample is selected from the group consisting of a fecal sample, a milk sample, and a blood sample.

25 31. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:

contacting said biological sample with the polypeptide of claim 17, wherein a polypeptide-antibody complex is produced if an antibody having specific binding affinity for said polypeptide is present in said sample; and

30 detecting the presence or absence of said polypeptide-antibody complex,

wherein the presence of said polypeptide-antibody complex indicates the presence of *M. paratuberculosis* in said biological sample, and wherein the absence of said polypeptide-antibody complex indicates the absence of *M. paratuberculosis* in said biological sample.

5

32. The method of claim 31, wherein said polypeptide is attached to a solid support.

33. The method of claim 31, wherein said biological sample is selected from
10 the group consisting of a blood sample or a milk sample.

34. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:

contacting said biological sample with the antibody of claim 20, wherein
15 an antibody-polypeptide complex is produced if a polypeptide is present in said biological sample for which said antibody has specific binding affinity, and

detecting the presence or absence of said antibody-polypeptide complex,
wherein the presence of said antibody-polypeptide complex indicates the presence of *M. paratuberculosis* in said biological sample, and wherein the absence of
20 said antibody-polypeptide complex indicates the absence of *M. paratuberculosis* in said biological sample.

35. The method of claim 34, wherein said antibody is bound to a solid support.

25 36. The method of claim 34, wherein said biological sample is selected from the group consisting of a blood sample or a milk sample.

37. A method of preventing infection by *M. paratuberculosis* in an animal, comprising the steps of:

30 administering a compound to said animal, wherein said compound comprises the polypeptide of claim 17,

wherein said compound immunizes said animal against *M. paratuberculosis*.

38. A method of preventing infection by *M. paratuberculosis* in an animal,
5 comprising the steps of:

administering a compound to said animal, wherein said compound
comprises the nucleic acid of claim 1,

wherein said compound immunizes said animal against *M. paratuberculosis*.

10

39. An isolated nucleic acid, wherein said nucleic acid comprises a nucleic acid molecule of at least 10 nucleotides, said molecule having at least 75% sequence identity to a sequence selected from the group consisting of SEQ ID NOs:1-22 and SEQ ID NO:23 or to the complement a sequence selected from the group consisting of SEQ ID
15 NOs:1-22 and SEQ ID NO:23, wherein any said molecule that is 10 to 30 nucleotides in length, under standard amplification conditions, generates an amplification product from *M. paratuberculosis* nucleic acid using an appropriate second nucleic acid molecule, but does not generate an amplification product from nucleic acid of any of the organisms selected from the group consisting of *Ralstonia solanacearum*, *Sinorhizobium meliloti*,
20 *Homo sapiens*, *Mesorhizobium loti*, *Oryza sativa*, *Drosophila melanogaster*, *Rhizobium leguminosarum*, *Xylella fastidiosa*, *Deinococcus radiodurans*, *Achromobacter cycloclastes*, *Candida cylindracea*, *Streptomyces lavendulae*, *Streptococcus pneumoniae*, *Mycobacterium tuberculosis*, *Pseudomonas aeruginosa*, *Sus scrofa*, *Mycobacterium leprae*, *Streptomyces coelicolor*, *Pseudomonas sp.*, *Thauera aromatica*, *Brucella melitensis*, *Streptomyces noursei*, *Rhizobium meliloti*, *Synechococcus elongates*,
25 *Rhodobacter capsulatus*, *Agrobacterium tumefaciens*, *Mycobacterium smegmatis*, *Drosophila virilis*, *Mus musculus*, *Leishmania major*, *Botrytis cinerea*, *Caulobacter crescentus*, *Rhodobacter sphaeroides*, *Spermatozopsis similes*, *Giardia intestinalis*, *Triticum aestivum*, *Bovine herpesvirus*, *Streptomyces sp.*, *Streptomyces peucetius*,
30 *Rhizobium sp.*, *Haloferax volcanii*, *Streptomyces viridochromogenes*, *Felis catus*, *Xanthomonas campestris*, *Thermotoga maritime*, *Thermotoga neapolitana*, *Frankia alni*,

Halobacterium NRC-1, *Glycine max*, *Leishmania tarentolae*, *Neisseria meningitides*, *Escherichia coli*, *Caenorhabditis elegans*, *Leishmania mexicana*, *Zea mays*, *Ictalurid herpesvirus*, *Rattus norvegicus*, *Arabidopsis thaliana*, *Pseudomonas fluorescens*, *Pantoea agglomerans*, *Erwinia uredovora*, *Pantoea ananatis*, *Streptomyces hygroscopicus*,
 5 *Rickettsia typhi*, *Pseudomonas cruciviae*, *Xanthomonas albilineans*, *Halobacterium salinarium*, *Micromonospora griseorubida*, *Pseudomonas paucimobilis*, *Streptomyces lividans*, *Pyrobaculum aerophilum*, *Sinorhizobium meliloti*, *Mesorhizobium loti*, *Bacillus halodurans*, *Trypanosoma rangeli*, *Trypanosoma minasense*, *Trypanosoma leeuwenhoekii*, and *Brassica napus* using an appropriate third nucleic acid molecule.

10

40. An isolated polypeptide encoded by the nucleic acid of claim 39.

41. The isolated polypeptide of claim 40, wherein said polypeptide has an amino acid sequence selected from the group consisting of SEQ ID NOs:24-44 and SEQ
 15 ID NO:45.

42. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:

contacting said biological sample with one or more nucleic acids
 20 comprising a nucleic acid molecule having a sequence selected from the group consisting of SEQ ID NOs:1-22 and SEQ ID NO:23 under standard amplification conditions, wherein an amplification product is produced if *M. paratuberculosis* nucleic acid is present in said biological sample; and
 detecting the presence or absence of said amplification product,
 25 wherein the presence of said amplification product indicates the presence of *M. paratuberculosis* in the biological sample, and wherein the absence of said amplification product indicates the absence of *M. paratuberculosis* in the biological sample.

43. The method of claim 42, wherein said one or more nucleic acids comprise a sequence selected from the group consisting of SEQ ID NOs:46-100 and SEQ ID NO:101.

5 44. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:
 contacting said biological sample with one or more nucleic acids comprising a nucleic acid molecule having a sequence selected from the group consisting of SEQ ID NOs:1-22 and SEQ ID NO:23 under hybridization conditions, wherein a
10 hybridization complex is produced if *M. paratuberculosis* nucleic acid molecules are present in said biological sample; and
 detecting the presence or absence of said hybridization complex, wherein the presence of said hybridization complex indicates the presence of *M. paratuberculosis* in said biological sample, and wherein the absence of said
15 hybridization complex indicates the absence of *M. paratuberculosis* in said biological sample.

 45. The method of claim 44, wherein said one or more nucleic acids comprise a sequence selected from the group consisting of SEQ ID NOs:46-100 and SEQ ID
20 NO:101.

 46. A method for detecting the presence or absence of *M. paratuberculosis* in a biological sample, comprising the steps of:
 contacting said biological sample with a polypeptide having an amino acid
25 sequence selected from the group consisting of SEQ ID NOs:24-44 and SEQ ID NO:45, wherein a polypeptide-antibody complex is produced if an antibody having specific binding affinity for said polypeptide is present in said sample; and
 detecting the presence or absence of said polypeptide-antibody complex, wherein the presence of said polypeptide-antibody complex indicates the
30 presence of *M. paratuberculosis* in said biological sample, and wherein the absence of

said polypeptide-antibody complex indicates the absence of *M. paratuberculosis* in said biological sample.

47. A method for detecting the presence or absence of *M. paratuberculosis* in
5 a biological sample, comprising the steps of:

contacting said biological sample with an antibody having specific binding
affinity for a polypeptide having an amino acid sequence selected from the group
consisting of SEQ ID NOs:24-44 and SEQ ID NO:45, wherein an antibody-polypeptide
complex is produced if a polypeptide is present in said biological sample for which said
10 antibody has specific binding affinity, and

detecting the presence or absence of said antibody-polypeptide complex,
wherein the presence of said antibody-polypeptide complex indicates the
presence of *M. paratuberculosis* in said biological sample, and wherein the absence of
said antibody-polypeptide complex indicates the absence of *M. paratuberculosis* in said
15 biological sample.

48. A method of preventing infection by *M. paratuberculosis* in an animal,
comprising the steps of:

administering a compound to said animal, wherein said compound
20 comprises a polypeptide having an amino acid sequence selected from the group
consisting of SEQ ID NOs:24-44 and SEQ ID NO:45,
wherein said compound immunizes said animal against *M.*
paratuberculosis.

49. A method of preventing infection by *M. paratuberculosis* in an animal,
comprising the steps of:

administering a compound to said animal, wherein said compound
comprises the nucleic acid of claim 39,
wherein said compound immunizes said animal against *M.*
30 *paratuberculosis*.

50. A composition comprising a first oligonucleotide primer and a second oligonucleotide primer, wherein said first oligonucleotide primer and said second oligonucleotide primer are each 10 to 50 nucleotides in length, and wherein said first and second oligonucleotide primers, in the presence of *M. paratuberculosis* nucleic acid, generate an amplification product under standard amplification conditions, but do not generate an amplification product in the presence of *M. avium* subsp. *avium* nucleic acid.

51. An isolated nucleic acid, wherein said nucleic acid comprises a nucleic acid molecule greater than 10 nucleotides in length, said molecule having at least 75% sequence identity to SEQ ID NO:1355 or to the complement of SEQ ID NO:1355, wherein said molecule hybridizes under stringent conditions with *M. paratuberculosis* nucleic acid but does not hybridize with *M. avium* subsp. *avium* nucleic acid under the same hybridization conditions.

52. An article of manufacture, wherein said article of manufacture comprises the composition of claim 50.

53. An article of manufacture, wherein said article of manufacture comprises the isolated nucleic acid of claim 1.
